BOUNDARIES OF SEABED JURISDICTION OFF THE PACIFIC COAST OF ASIA,
N. Ely, and R. F. Pietrowski, Jr.
Natural Resources Lawyer, Vol 8, p 611-629 (1976). 19 p, 43 ref.

Descriptors: *Ownership of beds, *Water resources development, *Foreign countries, *Continental shelf, *Boundary disputes, Oceans, United Nations, Foreign waters, Treaties, Law of the sea, International waters, Mining, Legal aspects, International law, International commissions.
Identifiers: *Geneva Conventions of 1958, *International Court of Justice, *Coastal zone management.

Asian coastal states should have exclusive jurisdiction to license the seabed resources of marginal seas that they enclose, without regard to depth or distance. This right is supported by the International Court of Justice's North Sea decision, which said that undersea areas can be and often are submarine prolongations of land territories. Principles which should determine boundaries between these states are listed and explained. Specific geographical features, such as the Yellow Sea, the East China Sea, the South China Sea and the Gulf of Thailand are the subjects of seabed boundary evaluations. (Frank-Florida)

PROPERTY RIGHTS IN THE WORLD OCEAN,
Resources for the Future, Inc., Washington, D.C.
F. T. Christy, Jr.
Natural Resources Journal, Vol 15, p 695-71 (October 1975). 18 p, 15 ref.

Descriptors: *Mining, *Continental shelf, *Ownership of beds, *United Nations, *Law of the sea, *Water resources development, Economics, Economic feasibility, Economic efficiency, Manganese, Mineral industry, International law, International waters, Oceans, Legislation, Federal jurisdiction, Jurisdiction.
Identifiers: *Coastal waters.

In the past, the cost to coastal nations of keeping an ocean area exclusive was greater than the potential benefits to be derived. This assessment in doubt today as nations are on the verge of ocean resource mining. Costs and benefits are unknown. Thus, property rights are also in flux as nations are attempting to base their legal rights on economic factors. Alternative schemes include an enterprise system, a licensing system, and unilateral protection of national entrepreneurs. Consequences of these plans are discussed, as well as the likelihood of implementation. Considerable economic waste exists today from the common property condition but it is unknown whether political pressures for unilateral sovereignty are justified. The United Nations Conference on the Law of the Sea, as well as further research, will hopefully provide some of the answers, both political and economic. (Frank-Florida)

ents, State jurisdiction, Rivers, Streams, Water
v, Federal reservations.

recent federal district court decision, U. S. v.
ashington, held that certain treaties in the
rthwest gave Indians the opportunity to harvest
% of the salmon and steelhead run. The decision
examined here in light of the history of fishing
hts in the area, as well as the evolution of state
ulation of off-reservation indian treaty fishing.
e treaty was held to be not a grant of rights to
Indians, but a grant of fishing rights from
m, with all rights not granted reserved to the In-
ns. Taking of fish on off-reservation land
nted by treaty, although previously regulated
the state, must be excluded from such regula-
. However, treaty limits grant the Indians only
qual share of fishing rights in conjunction with
-Indians in the areas designated. (Frank-

methods of control of land and water uses in
astal zone' of the Coastal Zone Management
f 1972 are examined. Three methods deter-
the manner in which the state's coastal zone
gement program will be implemented. They
ocal regulation according to state guidelines;
state regulation; and state administrative
of plans for consistency with state manage-
program. This paper describes the derivation
three models from past experience in
ce management at the Federal and state
and identifies and analyzes the potential ad-
es for each method. Next, it documents a
which indicates that more states are con-
g using the first method alone or in com-
n with either the second or third methods.
, it concludes that the most efficious pro-
would consist of a mix between the first and
methods. In the resulting 'suggested
l' the state would directly regulate regional
while there would be local government
g and regulation for all other uses. (Sinha-

Identifiers: Coastal zone management, Coastal waters.

With seabed mineral mining about to undergo substantial expansion, nationalism has intruded by presenting an increase in the number of extended coastal economic zones. Related problems include responsibility for water pollution and for new methods of technology. Coastal nations are extending their zones to the limits of the continental shelf, with the result that land-locked nations seem to be losing any chance for sharing in seabed resources. The author proposes that such interests be protected under the proposed United Nations Charter of Economic Rights and Duties of States. Under a new seabed authority, coastal nations would donate an agreed percentage of mineral values, including hydrocarbon proceeds. Assistance in technology and development could also be granted. This trend is slow in coming, however, and the current energy squeeze makes cooperation more unlikely. Manganese nodule mining seems to be the most economical subject for such cooperation. (Frank-Florida)

DEEPSEA VENTURES: EXCLUSIVE MINING RIGHTS TO THE DEEP SEABED AS A FREEDOM OF THE SEA,
J. G. Jackson.
Baylor Law Review, Vol 28, p 170-186 (Winter 1976). 17 p, 67 ref.

Descriptors: *Mining, *Law of the sea, *International law, *United States, *Manganese, Economics, International waters, Exploration, Continental shelf, Development, Legal aspects, Conferences, United Nations, Feasibility, Coasts, Foreign countries.
Identifiers: Coastal waters.

Examined here is whether exclusive rights to seabed resources have legal precedent in the law governing the surface of the high seas. Deepsea Ventures Inc., a United States company, claimed exclusive rights to seabed manganese nodules in the northern Pacific Ocean. The basis of this claim was extensive, resting on international conventions, international custom and generalized principles of law. Concern arose over the United States' reluctance to claim outright the seabed for itself and, therefore, over who would ultimately be responsible for any damages that might result from the mining. The author urges that the company be denied its exclusive rights due to the probable retaliation of other coastal states. The Law of the Sea should not be governed by gunboat diplomacy. ADJUDICATION OF INDIAN AND FEDERAL WATER RIGHTS IN THE FEDERAL COURTS: UNITED STATES V AKIN.
University of Colorado Law Review, Vol 46, No 4, p 555-85 (1975). 31 p.

Descriptors: *Indian reservations, *Federal reservations, *Federal-state water rights conflicts, *Federal jurisdication, Reservation doctrine, State jurisdiction, Water rights, Colorado, Judicial decisions, National parks, National historic sites, National recreation areas.
Identifiers: *McCarran Amendment.

A recent federal appellate decision allows federal court jurisdiction over water rights adjudications when the United States asserts proprietary interests as plaintiff. Examined here is the relationship of the McCarran Amendment to federal jurisdiction. The amendment removes federal sovereign immunity in water adjudications. The author concludes that the federal courts should not rely on the abstention doctrine when state questions cannot dispose of constitutional issues. Furthermore, limited federal jurisdiction is preferred to prevent undue interference with state institutions and for protection of legitimate state interests. When the United States files as plaintiff for determination of federal rights the choice of federal forum should be seriously considered but priority of suit may not always be an appropriate determination when an ongoing state procedure is present. With regard to determination of Indian water rights the author determines that state courts are without jurisdiction. (Comer-Florida)

THE SETTLEMENT OF INTERNATIONAL ENVIRONMENTAL DISPUTES,
Wisconsin Univ., Madison. School of Law.
R. B. Bilder.
University of Wisconsin Sea Grant College Program, Technical Report 231, University of Wisconsin (February 1976). 92 p.

Descriptors: *Foreign countries, *International law, *Law of the sea, *Jurisdiction, *Environmental control, Economics, Air pollution, Water pollution, Water policy, Political aspects, Legal aspects, Environmental engineering, Environmental sanitation, Economic impact, Exploitation, Governments, International commission, Water resources development.

International environmental concern is a phenomenon of the past decade. It is a rapidly growing, complex, and poorly defined field with a great amount of potential, as well as controversy, in specific areas. This monograph presents five lectures dealing with disputes arising and methods of settlement in the international environmental sphere. The lectures focus on disputes concerning international rivers and lakes, marine environment, air pollution, and on new frontiers such as outerspace and nuclear testing. Each lecture presents an overview of relevant law relating to the area discussed and then analyses actual disputes and their solution. Some actual problems treated are the Colorado River salinity dispute, the Lake Lanoux dispute, the Finnish arsenic dumping incident, the recent Law of the Sea Conference, the Ozone problem, Scandanavia's 'acid rain', and the St. Clair River problem. The concluding lecture presents some principles of international law related to the environmental problem. Recognition of international responsibility, flexibility in problem solving, development of knowledge and avoidance of disputes are some of the principles explored. (Comer-Florida)

U. S. DEFINES POSITION ON 200-MILE ECONOMIC ZONE AT CONFERENCE ON THE LAW OF THE SEA,
Rhode Island Univ., Kingston. Law of the Sea Inst.
J. R. Stevenson.
Department of State Bulletin, Vol. 71, p. 232-236, August 5, 1974. 5 p.

Descriptors: *United Nations, *Law of the sea, *Boundary disputes, *Jurisdiction, *Treaties, Navigation, Straits, Navigable waters, Ownership of beds, Bodies of water, Oceans, Legal aspects, Political aspects, International law, Foreign waters, International waters, Foreign trade, Commercial fishing, Administration, Regulation, Pollution, Research, United States.
Identifiers: *Territorial sea, *Economic zone.

The U. S. Special Representative to the Third U. N. Conference on the Law of the Sea at Caracas addressed the Conference on July 11 and present his views on the objectives and accomplishments of the Conference. He noted the growing consensus for extending the twelve mile outer limit for territorial sea jurisdiction and for establishing two hundred mile outer limit for coastal state economic zones. He also addressed the issues of free transit through international straits and of non-discriminatory access to the resources of the seabed under the overviw of an international authority. Finally, he stated that the minimum objectives of the Caracas Session should be to complete treaty texts on: (1) the limits of the territorial seas and economic zones; (2) the formation of an international authority; (3) control of the seabed; and (4) measures for pollution control and scientific research. Florida Office of the Attorney General, Tallahassee. Dept. of Legal Affairs.
Op Att'y Gen Fla 075-108 (1975). 4 p.

Descriptors: *Local governments, *Florida, *Governmental interrelations, *Water districts, *Adoption of practices, State governments, Legislation, Legal aspects, Political aspects, Institutional constraints, Institutions, Planning, Regulation, Water law, Water policy, Administration, Management, Comprehensive planning, Control.

The Florida Attorney General was asked whether a special water management district could be established in Broward County, Florida, pursuant to Chapter 298 of the Florida Statutes in view of the recently enacted Broward County charter and of Chapter 165 of the statutues. He answered in the negative after tracing the legislative history of the chapters in question and analyzing a Florida District Court of Appeal case. Such districts may be established only in accordance with the provisions of Chapter 74-192, Laws of Florida. The Attorney General also analyzed the levying of ad valorem taxes by water management districts. (Reinders-Florida)

Identifiers: *Congressional hearings

Hearings were held on three bills, S 1687, S 1688 and S 2676, which would implement the Alaska Native Claims Settlement Act. Approximately 270 million acres are potentially designated for inclusion in five national conservation systems: the National Forest, Park Wild and Scenic Rivers, and Wildlife Refuge Systems, as well as a new Scenic Reserve System. Statements were entered in the record in support of the bills and contained explanations of the practical effects of the legislation. Rivers, streams and lakes to be included are specifically delineated, as well as fishing areas. (Frank-Florida)

MARINE MAMMAL PROTECTION OVERSIGHT.
Hearings---Sub Comm on Fisheries and Wildlife Conservation and the Environment—Comm on Merchant Marine and Fisheries, US House of Representatives, Oct 21, 29, 30, Dec 9, 1975, p 1-325.

Descriptors: *Conservation, *Marine fish, *Mammals, *Marine animals, *Fish conservation, Fishing, Fish farming, Fish populations, Protection, Aquatic life, Commercial fish, Permits, Legal aspects, Treaties, Oceans.

Oversight hearings have been held concerning the implementation of the Marine Mammal Protection Act. The relationship between purpoise conservation and tuna fishing practices was discussed on both the national and international levels. The participation of states in marine mammal management, as well as legal processes involved in their protection were also examined. The committee gave close scrutiny to the killing of seals and the fur trade, including both numbers killed and methods of killing. Members of the committee urged stronger penalties for indiscriminate or brutal seal killing. Finally, treaty obligations pertaining to tuna and seal-harvesting were discussed. (Frank-Florida)

Descriptors: *Planning, *Federal government, *Legislation, *Long-term planning, *Water resources development, Comprehensive planning, Natural resources, Political aspects, Decision making, Resource development, Water law, Water quality, Water policy, Land resources, Protection, Economics, Governments, Conservation, Soil conservation, Water conservation, Regulation.
Identifiers: Congressional hearings.

The Committee on Agriculture and Forestry submitted this report on S.2081, a bill to provide for furthering the conservation, protection, and enhancement of the Nation's land, water, and related resources for sustained use, and for other purposes. The Committee reports favorably thereon with an amendment and recommends passage of the bill. S.2081 would establish a mechanism for making long-range policy to encourage the wise and orderly development of the Nation's soil and water resources. Included with the report are: a short explanation of the provisions of the bill and the relevant factors to be considered in determining long-range policy; a discussion on the background and need for the legislation; a section-by-section analysis of the bill; and an estimate of the costs that would be incurred by the Federal Government as a result of enactment for the years 1977-1982. There is also an appen-

elineating the responsibilities and programs of ne Soil Conservation Service, an agency of the Department of Agriculture. (Reinders-Florida)

entifiers: *Congressional hearings.

earings have been held to find better ways to ex-d the Water Resources Planning Act (WRPA) in 76. Presented at these hearings were the views various states on issues such as the need for re federal funding and greater autonomy for er basin commissions. The states also requested ater representation on the Water Resources uncil (WRC), and the establishment of a re-nalized structure within it. Basically, the States nted expansion of the WRC in order to create a re cohesive national water resource policy. Ex-sion of Title III of the WRPA was suggested as eans of achieving greater effectiveness. As to e II, dealing with the River Basins Commis-, the majority of states felt that the Federal vernment should plan through it rather than ugh other agencies. This was especially true in rd to the Columbia River Basin. (Frank-rida)

LAW OF THE SEA: A STATE MUST EXERCISE SUBSTANTIAL CONTINUOUS AND RECOGNIZED AUTHORITY TO ESTABLISH A BODY OF WATER AS A HISTORIC BAY,
S. M. Stebbins.
Georgia Journal of International and Comparative Law, Vol 6, p 309-322 (1976). 14 p, 116 ref.

Descriptors: *Jurisdiction, *Continental shelf, *Bays, *Law of the sea, *Submerged Lands Act, Legal aspects, Legal review, Judicial decisions, Oil wells, State governments, Federal government, State jurisdiction, Federal jurisdiction, Legislation, Continental margin, Mineral industry.
Identifiers: *Coastal zone management.

Recent developments in water law indicate problems in deciding whether a state or the federal government has title to offshore oil deposits. The Submerged Lands Act granted inland water rights to the states; but the precise definition of offshore boundaries has yet to be made by Congress. The Supreme Court in a 1975 decision, U.S. v. Alaska, ruled that a state claiming land as an historic bay must show the exercise of substantial, continuous and recognized authority over that water. Alaska did not meet this burden, and the federal government retained title to the offshore rights. Exactly how much land belongs to the states and how much to the federal government is still unsettled. (Frank-Florida)

SETTLEMENT OF DISPUTES UNDER THE LAW OF OCEAN USE, WITH PARTICULAR REFERENCE TO ENVIRONMENTAL PROTECTION,
American Society of International Law, Washington, D.C.
J. L. Hargrove.
Georgia Journal of International and Comparative Law, Vol 6, p 181-196 (1976). 16 p, 36 ref.

Descriptors: *Treaties, *Water resources development, *Law of the sea, *United Nations, *International commissions, Water law, Legal aspects, Water rights, Legislation, Water policy, Governments, Judicial decisions, Legal review, International waters.

Examined here are formal procedures that will come into effect for the resolution of ocean disputes following a new, comprehensive law of the sea treaty. Expert committees will handle special classes of disputes, such as those concerning fisheries, pollution and scientific research. Where there are no special procedures, conciliation rules will be applicable. Where other disputes arise, binding decisions could be given by an arbitration tribunal, the Law of the Sea Tribunal, or any combination of the three. Substantive rules of great precision are required. Finally, resolution of environmental disputes will be left largely to the separate nations; thus, regulation of environmental activities will be kept to a minimum. (Frank-Florida)

AN INTERNATIONAL REGIME FOR THE SEABED BEYOND NATIONAL JURISDICTION,
Carnegie Endowment for International Peace, New York. International Law Program.
T. M. Franck.
Georgia Journal of International and Comparative Law, Vol 6, p 151-179 (1976). 29 p, 158 ref.

Descriptors: *United Nations, *International agreement, *Law of the sea, *Mining, *Economics, Legal aspects, Water law, Oceans, International commissions, Federal government, Foreign waters, Treaties, Manganese, United States, Water resources development.
Identifiers: *Third United Nations Conference on Law of the Sea.

The Third United Nations Conference on the Law of the Sea is presently working on establishing offshore limits for national economic zones. Several sets of limits are discussed, with benefits accruing to each. In all, however, the U.S., U.S.S.R., Canada, Australia and Indonesia will benefit the most. The system pushed presently by poor countries will result in a still greater discrepancy between rich and poor countries. Originally, more equitable proposals were advanced, but short-sighted poor nations demanded enlarged economic zones. Finally, the problems of any potential International Seabed Authority are listed. (Frank-Florida)

SOME BIOLOGICAL BACKGROUND FOR INTERNATIONAL LEGAL ACTS ON RATIONAL UTILIZATION OF THE LIVING RESOURCES OF THE WORLD OCEAN,
All-Union Research Inst. of Marine Fisheries and Oceanography; Moscow (USSR)
P. A. Moiseev.
Georgia Journal of International and Comparative Law, Vol 6, p 143-149 (1976). 7 p.

Descriptors: *Continental shelf, *Fishing, *United Nations, *International law, *Biology, *Food chains, Oceans, Food abundance, Food pyramids, Fish management, Fish harvest, Fish conservation, Fish, International waters, Marine fish, Marine fisheries, International commissions.

Present plans to maintain 200-mile coastal zones for fishing ignore the realities of ocean biology. Examined here is a system which would encourage the development of national fisheries. Since the vast majority of the world catch is in these waters, it would also encourage greater efficiency. While this system may function well both politically and militarily, it does not function well biologically. An increased efficiency of fish catch would disrupt, possibly forever, the possibility of sufficient future stocks. As of now, this fundamental fact is being ignored. (Frank-Florida)

INTERNATIONAL FISHERIES MANAGEMENT WITHOUT GLOBAL AGREEMENT: UNITED STATES POLICIES AND THEIR IMPACT ON THE SOVIET UNION,
Louisiana State Univ. Law Center, Baton Rouge.
H. G. Knight.
Georgia Journal of International and Comparative Law, Vol 6 p 119-142 (1976). 24 p, 97 ref.

Descriptors: *Jurisdiction, *International law, *Fisheries, *Fish management, *Treaties, Federal government, Legal aspects, Legislation, Oceans, Continental shelf, Economics, Permits, Fishing, Marine fish, Foreign countries.
Identifiers: *Coastal zone management.

The U.S. will adopt a 200-mile exclusive fishing zone in 1976 by way of the Magnuson bill. This will give the U.S. a superior bargaining position over the Soviet Union in the area of coastal fisheries exploitation. Other countries may make broad exclusive fishing zone claims, broad preferential

fishing zone claims, anadromous species claims, and multilateral and bilateral arrangements to take care of their fishing rights. Major facets of U.S. fishery policy are reviewed from 1954 to the present. Under the Magnuson bill, foreign nations will have to pay fishing rights fees set by the Secretary of Commerce. THE FREEDOM OF NAVIGATION UNDER INTERNATIONAL LAW,
London Univ. (England).
W. E. Butler.
Georgia Journal of International and Comparative Law, Vol 6, p 107-118 (1976). 12 p, 29 ref.

Descriptors: *International law, *Law of the sea, *Legal aspects, *Oceans, *Navigation, Negotiations, United Nations, Commercial fishing, Foreign waters, Foreign trade, Treaties, International waters, Boundaries(Surfaces), Boundary disputes.
Identifiers: *Coastal waters.

An informal negotiating text has emerged from the Geneva session of the Third U.N. Conference on the Law of the Sea. It still must be modified but tangible benefits can be expected from any draft treaty that follows. Should the Conference fail, however, to produce any revision of the law of the sea, it is possible that national demands for coastal water rights will be heard. Jurisdictional conflicts will then erupt as coastal states claim convergent economic and territorial rights. Navigation laws, in effect for centuries, could be disrupted as more and more of the ocean is claimed. Thus there is much riding on the Conference, as national pressures increase behind the scenes. Freedom of scientific research in international waters has never been fully accepted by the international community. With the coming of new national economic zone boundaries, there is a possibility that research will have limits imposed on both inside and outside these zones. A proposal exists now to grant an international authority the exclusive right to engage in scientific research. These possibilities are detrimental to the better use, understanding and research of the 'World Ocean', and should be rejected in favor of total research freedom. (Frank-Florida)

Identifiers: Off-shore oil drilling.

The International Law of the Sea Conference was convened to develop a treaty spelling out the economic and legal rights of all nations in the seas. A previous conference had given coastal nations the right to exploit their off-shore resources to a depth of 600 feet or deeper if technologically feasible. With the development of better equipment for dredging, a nation could claim resources hundreds of miles offshore. Two basic areas of agreement have been reached at the present conference. The first is to extend the territorial rights of a coastal nation to 12 miles out from the shore, while guaranteeing that the straits now treated as high seas would remain open to all ships. The second is to give coastal countries control over underwater resources within 200 miles of their shores thus requiring foreign corporations to negotiate rights to fish or mine within those areas. The major issue at the conference is how the area beyond the 200-mile limit will be mined. One suggestion is that a central sea-bed authority lease to multinational corporations who would then operate freely. The other is that all exploitation be closely controlled by a multigovernmental corporation. (Capehart-Florida)

Marine scientists from many countries are busy sampling, probing and testing the seas and the seabed. Russian and American marine scientists working together in a joint marine research program called Norpax have discovered new facts in water currents and global tectonics. In addition they have discovered and charted the location of seabed manganese nodule deposits. Mining of these new manganese nodule deposits is being actively pursued by many corporations and nations. In addition, ocean sources of gas and promising oil sites in the deep oceans have been located. Scientists are also looking to harvest thermal currents in the oceans as another energy source. The article concludes with an examination of recent developments in aquiculture where emphasis is being placed upon harvesting plankton, and encouraging people to try eating some of the 30,000 to 40,000 underutilized fish varieties. This book examines the role of international law in regulating the exploitation and use of the world's oceans. Problem areas include: the territorial sea; straits; canals; Continental Shelf and seabed; fisheries; and the conservation of living resources. If mankind is fully to utilize technology for peaceful purposes, there must be rational development of methods to regulate exploitation of living and mineral resources in international waters. ROBLEMS IN THE USE OF INTERNATIONAL TRAITS,
SSR Academy of Sciences, Moscow, Institute of ate and Law.
D. Barabolya.
: Oceans, Technology and Law, Chapter I, p 3- , Moscow, USSR Academy of Sciences, 1972.

escriptors: *Military aspects, *Ships, *Straits, nternational waters, *Law of the sea, Naviga- n, Jurisdiction, Political aspects, Law enforce- ent, Treaties, Foreign countries, Continental elf.
entifiers: Historic straits, International straits, chipelagic straits, Innocent passage.

is chapter examines Soviet proposals for a legal ime calling for freedom of navigation through jor international straits and international tes, as well as for the prohibitions of military neuvers in such areas. Straits are classified into following legal categories: strait leading to the rnal seas or bays of coastal states; 'historic' its located on the outskirts of basic interna- al routes which have economic and defense ificance for a coastal state; archipelagic its, specifically the Indonesian Archipelago, ch permit 'innocent passage'; straits leading to ed seas of major importance to a small group coastal states; and 'international straits' con- ting the high seas and serving as world routes. ximum territorial sea width in straits is cur- ly three miles; however, unilateral extentions mits suggest an acceptable new maximum of ve miles provided a two or three mile 'center e' is established as part of the 'high seas'. stal state jurisdiction and criminal jurisdiction also be limited so that ships will enjoy full im- ity from detainment and arrests while in sit. STATUS OF HISTORIC WATERS RINE AND PRACTICE),
Academy of Sciences, Moscow, Institute of d Law.

B. N. Nechaev.
In: Oceans, Technology and Law, Chapter 3, p 44-52, Moscow, USSR Academy of Sciences, 1972.

Descriptors: *Foreign countries, *International waters, *Law of the sea, *International law, Navigation, Political aspects, Law enforcement, Jurisdiction, Straits, History, Military aspects, Islands, Bays.
Identifiers: *Historic waters, *Historic bays, Archipelagos.

The 1958 International Convention on the Territorial Sea and Contiguous Zone lacks definitions and provisions concerning 'historic waters' and 'historic bays'. The norms of international maritime law are, therefore, controlling for activities of various countries in exercising sovereignty over 'historic waters'. It is generally recognized that 'historic waters' include straits, archipelagos, and bays. The following characteristic elements should be considered before classifying an area as a 'historic water': (1) the exercise of state authority over these waters for prolonged periods of time without opposition from the overwhelming majority of states; (2) the geographic condition of the bay, and its configurations; and (3) its economic and defense significance for that state. No unified opinion on the length of closing lines for bays has yet developed; consequently, states practices include exercise of jurisdiction over maritime areas adjacent to coasts which are vital to the state's security or economy. International experience has shown that states themselves first decide the condition and grounds upon which a bay is viewed as 'historic' and then international law sanctions the decision. LEGAL PROBLEMS OF THE TERRITORIAL SEA REGIME,
USSR Academy of Sciences, Moscow, Institute of State and Law.
L. V. Speranskaya.
In: Oceans, Technology and Law, Chapter 4, p 53-77, Moscow, USSR Academy of Sciences, 1972.

Descriptors: *Foreign countries, *Fishing, *Jurisdiction, *International waters, *Law of the sea, International law, Boundary disputes, Sea water, Coasts, Oceans, Continental shelf, Political aspects, Legal aspects, Fisheries.
Identifiers: *Territorial waters, *International Law Commission, *Territorial sea zone, Innocent passage.

The legal regulation of territorial waters, including questions regarding the breadth of the territorial seas, must take into account the level of scientific activity presently taking place in coastal seas. 'Territorial waters' means a belt of maritime space adjacent to the coastal state and measured either by a low-tide line or by the use of a straight baseline. The International Law Commission recognizes a twelve mile breadth extending into airspace above the territorial sea, as well as to the seabed and subsoil. Some states, however, in violation of international law, have declared a 200 mile wide territorial sea zone using self-defense as justification. These states require other nations to purchase licenses for exorbitant sums before allowing fishing within the 200 mile zone. However, they reserve sanitary and other pollution controls to a 12 mile zone only. (See also W76-12025) (Hadoulias-Florida)

THE OUTER BOUNDARY OF THE CONTINENTAL SHELF,
USSR Academy of Science, Moscow, Institute of State and Law.
S. N. Smirnov.
In: Oceans, Technology and Law, Chapter 5, p 78-98, Moscow, USSR Academy of Sciences, 1972.

Descriptors: *Foreign countries, *Jurisdiction, *Continental shelf, *International waters, *Law of the sea, International law, Boundary disputes, Legal aspects, Legislation, Sea water, Oceans, Military aspects, Water resources development, International commissions.
Identifiers: *Exploitability criteria, *International Law Commission, Geneva Convention.

The Continental Shelf, a rich source of minerals, needs special legislation delineating boundaries for spatial expansion of coastal states' sovereign rights. Relevant definitions and proposals for such legislation are included within this chapter. The most widespread definition of 'Continental Shelf' is the 'exploitability criteria' which states that the entire world ocean floor can be divided by median lines between coastal states. However, the International Law Commission after much debate adopted the geographical meaning of continental shelf. While outer boundaries of the Continental Shelf remain unclear, international legal norms allow coastal states sovereign rights over exploration and exploitation of the territorial sea to two hundred miles. Spatial extention of exploitability is limited only by the need for submarine regions to be contiguous to coastal states or islands. The United States agrees on the two hundred mile territorial sea, but recommends supervision by international trustees. (See also W76-12025) (Hadoulias-Florida)
W76-12030

THE DELIMITATION OF THE NORTH SEA CONTINENTAL SHELF,
Akademiya Nauk SSSR, Moscow. Inst. of State and Law.
A. L. Kolodkin.
In: Oceans, Technology and Law, Chapter 6, p 99-113, Moscow, USSR Academy of Sciences, 1972.

Descriptors: *Foreign countries, *Jurisdiction, *Continental shelf, *International waters, *Law of the sea. International law, Boundary disputes, Judicial decisions, Geographical regions, Political aspects, Legal aspects, International commissions, Beds, Water resources development.
Identifiers: Equidistance(Legal), Geneva Convention.

The International Court of Justice in 1969 examined differing principles for delimiting the Continental Shelf of the North Sea. Article 6 of the 1958 Geneva Convention provided for delimitation by agreements between states, or, in the absence of such agreements or special circumstances justifying another boundary, according to principles of equidistance. The Court decided that since the articles of the Convention did not bind non-Convention members, equidistance was not the sole method available for delimiting the Continental Shelf of the North Sea. The Court felt that other factors, such as the general configuration of the coast line, the physical and geological structure of the Shelf Area, and elements of 'reasonable proportionality' should also be taken into consideration. The Soviet Union's position is that the Rules of Article 6 and of other Convention articles are rules of Customary International Law and, therefore, binding on all states. Furthermore, the principle of equidistance should be applied only in the absence of specific agreements or special circumstances. (See also W76-12025) (Hadoulias-Florida)

SCIENTIFIC-TECHNOLOGICAL PROGRESS AND THE SEARCH FOR LEGAL REGULATION OVER POSSIBLE USES OF THE OCEAN FLOOR,
Akademiya Nauk SSSR, Moscow. Inst. of State and Law.
M. I. Lazarev.
In: Oceans, Technology and Law, Chapter 7, p. 114-129, Moscow, USSR Academy of Sciences, 1972. 16 p.

Descriptors: *Foreign countries, *Water resources development, *International waters, *Law of the sea, *International law, Regulation, Oceans, Subsoil, Geographical regions, Legal aspects, Technology, Political aspects, Treaties, International commissions, Mining, Ownership of beds.
Identifiers: *Seabeds, *Freedom of the high seas.

Various legal viewpoints have been presented for regulating development of the ocean floor and subsoil. These viewpoints include the 'legal vacuum', 'belonging to no one', 'belonging to everyone', and the 'common property of all mankind' concepts. The United Nations (UN) General Assembly adopted the last of these, to which the Soviet Union made the following objections: (1) the concept calls for equal rights to world ocean resources but ignores the basic differences between developed and underdeveloped states; (2) artificial divisions into nations 'working on the sea' and those 'reaping fruits of the sea' are created in contradiction to the UN Charter; (3) the concept may hinder scientific research and curtail technological initiatives; and (4) political propaganda for 'sharing the seabed' is beneficial to imperialistic powers. The Soviet Union suggests that until there arises a treaty regime mutually acceptable to all states for the common use of the seabed and subsoil, these areas should be commonly used by all states under principles of freedom of the high seas. (See also W76-12025) (Hadoulias-Florida)
W76-12032

LEGAL REGULATION OF SEABED USES BEYOND THE LIMITS OF THE CONTINENTAL SHELF,
Akademiya Nauk SSSR, Moscow. Inst. of State and Law.
G. F. Kalinkin.
In: Oceans, Technology and Law, Chapter 8, p. 130-70, Moscow, USSR Academy of Sciences, 1972. 41 p.

Descriptors: *Foreign countries, *Water resources development, *International water, *International law, *Continental Shelf, Regulation, Oceans, Legal aspects, Political aspects, Resources, Treaties, Legislation, Mining, Ownership of beds, Boundary disputes.
Identifiers: *Demilitarization, *Seabeds, Convention on the High Seas.

This chapter deals with several issues relating to the exploitation and use of the seabed. The Convention on the High Seas has confirmed that 'freedom of the high seas' also extends to the seabed. Consequently, a Disarmament Committee Treaty providing for demilitarization of the seabed has been approved. Various legal studies calling for establishment of an international legal regime for exploitation of seabed resources are reviewed. Also analyzed are U. N. studies advocating international machinery for regulation of the seabed by registering claims for seabed resource exploitation through licensing procedures, or by conducting such exploitation under the supervision of an independent international agency. The American Draft Convention, by comparison, has proposed an international trusteeship area where states adjacent to the area would have power to issue licenses for exploitation of seabed mineral resources. The Soviet Union, however, deems it unnecessary to develop international machinery until boundaries of national jurisdiction for the seabed have been established. Also discussed is the UN proclamation declaring the seabed and the ocean floor to be the 'common heritage of mankind'. (See also W76-12025) (Hadoulias-Florida)
W76-12033

INTERNATIONAL-LEGAL PROTECTION OF THE SEAS FROM POLLUTION,
Akademiya Nauk SSSR, Moscow. Inst. of State and Law.
Ya. A. Ostrovski.
In: Oceans, Technology and Law, Chapter 9, p 171-93, Moscow, USSR Academy of Sciences, 1972.

Descriptors: *Foreign countries, *Oil spills, *International waters, *Law of the sea, *International law, *Oil pollution, Pollution, Legal aspects, Political aspects, Legislation, Treaties, Radioactivity effects, Ecology, Environmental effects, Water pollution effects, Oceans, International commissions.
Identifiers: *Law of the Sea Conference.

The danger of oil pollution in international waters is critical. Pollution control measures began in 1926 when a preliminary conference of experts drafted an agreement recommending the establishment of government zones in which the discharge of gasoline and other harmful mixtures would be prohibited. Other conventions followed. Discussed are the International Convention in London in 1954 and the 1962 Amendments thereto which established different regimes according to ship type; the 1969 North Sea Convention; the 1969 Baltic Sea Convention; and the 1969 Conference in Rome and Brussels. In addition to oil pollution, other dangerous areas of pollution examined includes pollution in rivers and internal reservoirs from sewage, industrial wastes, various chemical substances, and radioactive contaminations. The Geneva Law of the Sea Conference recognized the need to adopt international measures to prevent dumping radioactive wastes into the sea. With modern technological advances, possible uses of the world's oceans are limited only by the dangers of pollution. (See also W76-12025) (Hadoulias-Florida)
W76-12034

INTERNATIONAL-LEGAL REGULATION OF MARINE FISHERIES,
A. A. Volkov.
In: Oceans, Technology and Law, Chapter 10, p. 194-209, Moscow, USSR Academy of Sciences, 1972.

Descriptors: *Foreign countries, *Jurisdiction, *International waters, *Law of the Sea, *Fisheries, Regulation, Oceans, Legal aspects, Legislation, Political aspects, Fish, Fish management, International commissions.
Identifiers: *Law of the Sea Conference.

Effective regulatory methods are necessary to control the exploitation of the living resources of the world's oceans. The most urgent concerns involve the establishment of a territorial sea width and fishing zone, and the resolution of problems of coastal states' rights in the high seas and in marine fisheries. The regulation of fisheries is complicated by differing international legal regimes concerning internal waters, territorial seas, high seas, and the Continental Shelf. The situation is further aggravated by the inability of the Law of the Sea Conferences to reach agreement on general rules establishing maximum limits for the breadth of territorial seas and fishing zones. Of particular interest are the positions expressed by American and Canadian fishermen, and the tendency of individual coastal states unilaterally to seize vast areas of the high seas. The Soviet Union objects to the organized activity by capitalist coastal states against Soviet fisheries. The Soviets especially object to the establishment of official prohibitions on port ships for Soviet fishing vessels in Canadian, Mexican and Australian Pacific Ocean ports. (See also W76-12025) (Hadoulias-Florida)
W76-12035

INTERNATIONAL-LEGAL PROTECTION OF THE LIVING RESOURCES OF THE SEA,
Akademiya Nauk SSSR, Moscow. Inst. of State and Law.
G. A. Nekrasova.
In: Oceans, Technology and Law, Chapter 11, p 210-226, Moscow, USSR Academy of Sciences, 1972.

Descriptors: *Foreign countries, *Water resources development, Technology, *International waters, *Law of the sea, Legislation, Pollution, Water pollution, Treaties, Regulation, Environmental effects, Conservation, Resources, Sea water, Oceans, Aquatic animals, Aquatic life, Mining wastes.
Identifiers: *Declaration on the Continental Shelf of the Baltic Sea.

The living resources of the Baltic Sea urgently need protection to prevent their extermination by harmful side effects of scientific progress. Resolution of technology caused problems is proceeding through international programs and agreements for joint exploitation of marine resources. International organizations are also conducting scientific studies of marine living resources and conservation measures. There were no international agreements for the conservation of living resources of the sea prior to 1911, but since then a number of international conferences have been devoted to the problem. The Soviet Union has given high priority to protecting the Baltic Sea. A number of international scientific conventions have discussed Baltic Sea pollution concerns; however, up to now the Baltic States have not concluded any regional agreement assuring protection of the area. Thus the Declaration on the Continental Shelf of the Baltic Sea should play an important political and legal function in protecting Baltic Sea ecology. (See also W76-12025) (Hadoulias-Florida)

THE SWALE,
Spessard L. Holland Law Center, Gainesville, Fla.
J. J. Altman, Jr.
Available from Eastern Water Law Center, University of Florida, Gainesville, Florida 32611 for $1.25. June 4, 1976, 25 p.

Descriptors: *Florida, *Surface drainage, *Natural flow doctrine, *Landfills, *Obstruction to flow, *Reasonable use, Alteration of flow, Relative rights, Riparian rights, Riparian waters, Ditches, Grassed waterways, Surface runoff, Surface waters, Drainage patterns(Geologic), Damages, Land tenure, Permits.
Identifiers: *Swales.

A 'swale', which is a watercourse carrying surface runoff, may contain flowing water all year-round or may serve only during flooding or rainfall periods. A swale may be natural, man-made or natural but enlarged artificially. In considering the right of a property owner to fill a swale, the natural or artificial nature of the waterway is important. Under Florida law a swale, as a 'man-made trench which is water filled only during rainfall', may be constructed and maintained without a permit. Under Federal law a similar provision exempts man-made ditches. Natural watercourses, however, may be subject to Federal Water Pollution Control Act jurisdiction and may present state common law problems. Under Florida law a lower downer may not block natural drainage of upper lands. In addition, the lower landowner is required to submit to all natural drainage running in a natural direction. If the swale is entirely man-made, however, and is not an improved natural drainage course, a landowner may fill the ditch. Fill would also be allowed if the ditch were carrying water other than surface drainage, as when a ditch drains a water body. Except in these limited instances, however, filling is not permitted. (Comer-Florida)

AVIGABLE WATER, A DEFINITION: ALL ENT OUT OF SHAPE,
essard L. Holland Law Center, Gainesville, Fla.
G. Madorsky.
vailable from Eastern Water Law Center, niversity of Florida, Gainesville, Florida 32611, 20. (1975), 44 p.

scriptors: *Federal jurisdiction, *Navigable ters, *Rivers and Harbors Act, *Federal Water llution Control Act, Legislation, Constitutional , Common law, Regulation, Water pollution ntrol, Water law, History, Rivers, Jurisdiction. ntifiers: *Navigability test, *FWPCA Amendnts of 1972, Oil Pollution Act, Navigation obuctions.

e Federal Constitution grants Congress the wer to regulate the navigable waters of the ntry under the Commerce Clause. The earliest icial interpretation of navigable waters was ed upon the English rule and encompassed only l waters. Since many major river systems were s excluded, the United States Supreme Court pted the 'navigability in fact test'. This test inled all waters that were used or susceptible of in their natural condition as commercial ways. Eventually, interstate waters, waters able of improvement to become navigable as l as tributary waters to navigable waters were ght under federal jurisdiction by judicial idening. With the beginnings of pollution con-, federal legislation was used to regulate gable waters. The legislation was not pletely effective, however, because of the e of federal jurisdiction. The Federal Water ution Control Act Amendments of 1972 pured to apply to all waters in the United States. e the act has been found constitutional, the der scope of jurisdiction promises better lt. AGRICULTURAL PRACTICES TO REDUCE NON-POINT POLLUTION IN THE OKEECHOBEE-KISSIMMEE BASIN,
Florida Univ., Gainesville. Inst. of Food and Agricultural Sciences.
L. B. Baldwin.
Available from Eastern Water Law Center, University of Florida, Gainesville, Florida 32611, $3.10 May 1975. 62 p, 1 fig, 6 tab.

Descriptors: *Agricultural runoff, *Florida, *Lake basins, *Farm wastes, *Confinement pens, Feed lots, Livestock, Cattle, Fertilizers, Crop production, Phosphorus compounds, Nitrogen compounds, Surface runoff, Vegetation effects, Wetlands, Drainage water, Water pollution sources, Water pollution treatment, Water pollution control.
Identifiers: Non-point sources(Pollution), *Okeechobee-Kissimee Basin(Fla).

Agricultural sources of non-point source pollution in the Okeechobee-Kissimmee Basin of Florida are predominantly dairies, beef production in improved pastures, sugarcane and vegetables on mucklands, and citrus on drained soils. Cattle production contributes significant amounts of phosphorus while crop production is the main source of nitrogen. Quantities of both elements can be reduced by utilization of wetlands to slow runoff and increase nutrient uptake prior to discharge into waterways. Use of methods to prevent herd cattle from congregating around drainage areas can keep manure from accumulating and flushing into drainage facilities. Feeding areas should also be spread out away from drainage areas and vegetable cover maintained to prevent nutrient wash-off. Dairy operations require a close confinement of cattle for long periods. This makes capture and disposal of wastes both necessary and feasible. If feed crops are raised the expense of waste collection can be mitigated. (Comer-Florida)

LEGAL STANDARDS FOR DETERMINING THE ORDINARY HIGH WATER MARK,
Spessard L. Holland Law Center, Gainesville, Fla.
R. W. Winesett.
Available from Eastern Water Law Center, University of Florida, Gainesville, Florida 32611, $1.75. 1972, 35 p.

Descriptors: *Florida, *Boundaries(Property), *High water mark, *Fluctuations, *Water levels, Texas, Arizona, Utah, Oklahoma, Oregon, Water law, Banks, Ownership of beds, Seashores, Tidal waters, Judicial decisions, Legal aspects.

Legal standards for ascertaining the ordinary high water mark have never been clear. Examined here is federal and Florida case law, as well as that of Texas, Arizona, Utah, Oregon and Oklahoma. In general, it appears that the ordinary high water mark (OHWM) is the outer limit of the land beneath navigable waters. However, the OHWM is a question of fact, to be determined by visual examination of the bank. While physical evidence has been accepted in the form of changed soil appearance at the water's edge or lack of terrestrial vegetation, the cases are by no means uniform. Thus, while it is a question of fact that determines the OHWM, as yet there is no universally accepted standard. (Frank-Florida)

EBB AND FLOW: NAVIGABILITY AND THE CORPS OF ENGINEERS WASHED IN THE TIDE OF ENVIRONMENTAL PROTECTION,
Spessard L. Holland Law Center, Gainesville, Fla.
C. P. Tittle.
Available from Eastern Water Law Center, University of Florida, Gainesville, Florida 32611, $1.60. 1972. 32 p, 2 append.

Descriptors: *Wetlands, *Judicial decisions, *Jurisdiction, *Federal government, *Dredging, Legislation, Legal review, Water policy, Constitutional law, Federal jurisdiction, Florida, Water law, High water mark, Landfills.

Navigability has been the cornerstone of federal power to enforce environmental wetland protection. Under the Commerce Clause and federal jurisdiction, the Corps of Engineers has issued and withheld permits for dredging and filling until 1970, however, jurisdiction had always depended on navigability of a waterbody. In 1970 a Fifth Circuit decision, Zabel v. Tabb, allowed the Corps to consider environmental factors in issuing permits. This landmark decision was implemented by a federal court in Florida which granted a permanent injunction against dredging, and even went so far as to order repairs. These Florida cases have greatly expanded the breadth of federal protection for wetlands. To a large degree, state power has been pre-empted, while the reach of the Commerce Clause has been greatly expanded. (Frank-Florida)

PUBLIC SERVITUDE FOR NAVIGATION ON ARTIFICIAL WATERS AND THE COMMERCE CLAUSE,
Spessard L. Holland Law Center, Gainesville, Fla.
R. L. Wilkes.
Available from Eastern Water Law Center, University of Florida, Gainesville, Fl. 32611. $1.55. (1973), 31 p.

Descriptors: *Artificial watercourses, *Florida, *Constitutional law, *Federal jurisdiction, *Navigable rivers, Navigable waters, Navigation, Water law, Legislation, Legal aspects, Judicial review, State governments, State jurisdiction, Beneficial use, Public rights.

The Commerce Clause of the Constitution, and the power of Congress to regulate navigable waters, constitute the foundation of all federal power over rivers and other waterways. Where artificial waterways are concerned, there are two ways to bring them within the Commerce Clause since they are not otherwise covered. First, one may show that the waterbody is in fact navigable; or second, one may show that it is navigable because it is capable of improvements. There is little case law dealing with Federal power in this area, but state case law is extensive. The author, after discussing cases from around the nation, concludes that whether or not public rights existed in a waterbody in its natural condition will determine whether public rights exist after it is made navigable by artificial means. Florida law on this point, both statutory and judicial, is also discussed. (Frank-Florida)
W76-12044

THE BENEFICIAL USE OF WATER RESOURCES AND GUIDELINES FOR ALLOCATION OF WATER RESOURCES IN TIMES OF EMERGENCY,
Spessard L. Holland Law Center, Gainesville, Fla.
D. L. Rankin.
Available from Eastern Water Law Center, University of Florida, Gainesville, Florida 32611, $1.85. March 1973, 37 p.

Descriptors: *Beneficial use, *Water allocation(Policy), *Water resources, *Droughts, *Florida, Riparian rights, Riparian land, Appropriation, Prior appropriation, Water rights, Water law, Texas, Idaho, California, Adoption of practices, State governments.
Identifiers: *Public trust doctrine.

Examined here are the beneficial uses of water resources in Florida, and guidelines for water resource allocation in times of emergency. Both are affected by the Florida Water Resources Act of 1972 which replaces certain common law con-

cepts of water rights. A discussion of the Model Water Code, from which the Act comes, includes a comparison of traditional reasonable use and beneficial use concepts. Ultimately, Florida has synthesized elements of both riparian and appropriation law. After delineating procedures for a water emergency declaration under the Act; the author suggests that where the priority system is inexact, as in Florida, four classes of permits be used. Water emergency proceudres in Texas, California and Iowa are also compared and analyzed. (Frank-Florida)

FEDERAL JURISDICTION OVER LANDFILLS ON SUB-AQUEOUS LANDS,
Spessard L. Holland Law Center, Gainesville, Fla.
J. M. Wehby.
Available from Eastern Water Law Center, University of Florida, Gainesville, Florida 32611, $1.65. November 1973. 33 p, 2 append.

Descriptors: *Protection, *Estuaries, *Federal jurisdiction, *Wetlands, *Rivers and Harbors Act, Constitutional law, Estuarine fisheries, Estuarine environment, Legal aspects, Judicial decisions, Legal review, Environmental effects, Environmental control, Legislation, Federal government.

Estuarine land has long been the victim of dredge, fill, and bulldozing. States have been unwilling or unable to protect these submerged areas. The federal government has thus had responsibility for much of the estuarine areas, subject to certain limitations. Courts have lately been expanding federal jurisdiction in these areas, basing their decisions on the Commerce Clause and the 1899 Rivers and Harbors Act. The author evaluates the protective effectiveness of the federal jurisdiction, and finds the results encouraging. Since Corps of Engineering permits are required in these areas, there has been an effective control on misdirected development. Submerged lands below the mean high water mark have been well protected, while protection of wetlands above the mark has been inadequate. To increase jurisdictional and protective effectiveness, the author recommends an amendment to the Rivers and Harbors Act to allow citizen suits. Overall, however, federal jurisdiction under the Act is sufficient to protect the environment. (Frank-Florida)
W76-12046

USE OF THE 'TRUST DOCTRINE' FOR WETLANDS PROTECTION,
Spessard L. Holland Law Center, Gainesville, Fla.
C. Felton.
Available from Eastern Water Law Center, University of Florida, Gainesville, Florida 32611, $1.65. (1973), 33 p.

Descriptors: *Protection, *Florida, *Constitutional law, *Judicial review, *Wetlands, Water policy, Water resources, Public access, Public rights, Public benefits, Water law, Wisconsin, Massachusetts, California, Water rights, History, Legal aspects, Beaches.
Identifiers: *Public trust doctrine.

The public trust doctrine is one favored method of protecting wetlands, especially beaches below the high tide line and river bank bottoms. It is as old as the common law, and in fact found its roots in the conflicts between weak English kings and their powerful lords. The author traces the doctrine's history from its beginnings to the present. Also examined is how the doctrine functions in different states, including California, Wisconsin and Massachusetts. Extensive coverage is given to the Florida constitutional provision establishing the doctrine. Relevant case law, both in and out of Florida, is analyzed along with the advantages that the provision gives the public as compared to previous legislation. Overall, establishment of the provision seems to be a step forward for wetland conservation in Florida. (Frank-Florida)
W76-12047

EFFLUENT CHARGES, TOWARDS A NEW ENVIRONMENT,
Spessard L. Holland Law Center, Gainesville, Fla.
C. E. Nilson.
Available from Eastern Water Law Center, University of Florida, Gainesville, Florida 32611, $1.65. (1973), 33 p.

Descriptors: *Costs, *Penalties(Legal), *Water pollution treatment, *Water pollution control, *Legislation, Legal aspects, Cost sharing, Cost-benefit analysis, Cost allocation, Economics, Water policy, Feasibility, Econometrics, Unit costs, Treatment facilities.

The basic question concerning effluent discharges today is that of financial responsibility when illegal discharges occur. Presently the public pays in the form of higher taxes for sewage treatment plants and other facilities. No incentive is given to the polluting industries to cut down. A more efficient system would impose effluent discharge rates on each industry. This way, it would cost the polluters to pollute. Since 80 to 90% of all wastes can be re-cycled, industry would have the incentive to stop pollution. Furthermore, effluent charges when imposed would result in higher unit retail prices, thus making a company less competitive. The Ohio plan is cited as an example of successful effluent discharge rates in this context. (Frank-Florida)
W76-12048

THE TAKING ISSUE, FLOOD PLAIN AND WETLANDS ZONING,
Spessard L. Holland Law Center, Gainesville, Fla.
D. E. Thomas.
Available from Eastern Water Law Center, University of Florida, Gainesville, Florida 32611, $1.20. May 1975, 24 p.

Descriptors: *Flood plain zoning, *Water zoning, *Constitutional law, *Regulation, *Reasonable use, Land use, Recreation, Parks, Industries, Land tenure, Natural resources, Watersheds(Basins), Land classification, Land development, Topography, Land resources, Land management, Real property, Land appraisals, Economics, Eminent domain.
Identifiers: Fill permits.

Preventing development of flood plains and wetlands by zoning is a relatively recent phenomenon. A major question arising from such zoning is whether the effect is such as to be a 'taking' of property without compensation. The traditional test used to determine whether a regulation is actually a taking is the diminution of value test. Under that test, a taking occurs if the owner is deprived of any reasonable use of his property. A number of private property oriented courts have used this test to strike down flood plain and wetland zoning. According to these courts, agricultural, recreational and parkland uses are not reasonable uses. Some other courts, however, have declared the allowable uses to be reasonable. These courts have apparently weighed public interests more heavily than private use. The most innovative consideration of the taking issue was made by a Wisconsin court. According to that forum, police power exercised to protect the public from harm cannot be a taking. Eminent domain taking is exercised only for public benefit; retaining natural land forms is not a benefit but merely a protection from harm. (Comer-Florida)

FEDERAL REGULATION IN THE LICENSING OF NUCLEAR POWER PLANT FACILITIES,
Spessard L. Holland Law Center, Gainesville, Fla.
R. L. Oftedal.
Available from the Eastern Water Law Center, University of Florida, Gainesville, Florida 32611. Price $1.75. June 1976, 35 p.

Descriptors: *Administrative agencies, *Federal government, *Nuclear power plants, *Nuclear reactors, *Permits, Nuclear energy, Nuclear engineering, Thermal pollution, Fishkill, Heated water, Heat balance, Heat flow, Rivers, Streams, Water law, Administrative decisions, Administration.
Identifiers: *National Environmental Policy Act, *Licenses.

Nuclear plant construction has been a source of controversy throughout the last two decades. Examined here is the plant licensing process in the light of new and existing federal regulations and judicial decisions, and the rate and effectiveness of the regulatory agencies involved. A licensing process that extends over a decade may be unjustifiable in light of rapid technological development. Also analyzed are application procedures, the effect of the National Environmental Policy Act, and other water quality control legislation. The passage of the Nuclear Facility Licensing Act would shorten the licensing process by three to four years. Generic rulemaking and increased standardization are also steps that need to be taken. Delays in licensing, if uncorrected, could lead to greater interest in conventional energy production, especially since the goals set by President Ford for 1980 already seem unlikely to be reached. (Frank-Florida)

D PROTECTION ZONING AS A FACTOR CTERMINING DAMAGES IN EMINENT IN PROCEEDINGS,
rd L. Holland Law Center, Gainesville, Fla.
brook.
ble from the Eastern Water Law Center, sity of Florida, Gainesville, Florida 32611, 1.30. (1976), 26p.

tors: *Florida, *Wetlands, *Damages, plain zoning, *Eminent domain, Property Constitutional law, Compensation, Zon-gislation.

nstitutional validity of flood plain zoning is r to be determined on a case by case basis. court determines that a zoning regulation s to a constitutional taking, the state should eminent domain proceedings to determine ropriate compensation payment to the in-wner. The traditional damages measure-eminent domain proceedings is the price pon at sale between a willing seller and a buyer. Because of this formula, the flood nd wetlands ordinance itself becomes a damages determination since a purchaser rtainly consider it. The effect of the zon-property value usually is depressive zoning restricts use. While some courts le to such evidence because of suspicion tive intent to depress such value, Florida r state courts are not hostile and allow of value depression. So long as there is an a speculative possibility of zoning he effect of such change on land value can be considered as damages evidence. (Comer-Florida)
W76-12054

COASTAL ZONE MANAGEMENT IN FLORIDA: THE NEED FOR A COMPREHENSIVE PROGRAM,
Spessard L. Holland Law Center, Gainesville, Fla.
P. Coutney.
Available from the Eastern Water Law Center, University of Florida, Gainesville, Florida 32611, Price $5.15. (1975), 103 p.

Descriptors: *Erosion, *Florida, *Coastal plains, *Coastal marshes, *Legislation, Seashores, Beaches, Shores, Planning, Water resources, Water law, Future planning(Projected), Coasts, State governments, Water resources development, Federal government.
Identifiers: *Coastal waters, *Coastal zone management.

This note presents a system of suggested legislative reforms that would reconcile coastal zone management with conflicting land use demands. Florida coastal zone law is emphasized. Sources of funding are listed, mainly from the federal government, that would finance anticipated state programs. The main example of suggested legislation is a proposed coastal zone management act for Florida. The author sees legal weaknesses in that there is no comprehensive plan for development; furthermore, not all coastal land is regulated. Only submerged lands and beaches are protected when threatened by erosion even though the entire coastal zone should be protected. Finally, the author favors the establishment of a distinct coastal zone agency, although it should be kept within the confines of an overall state plan. (Frank-Florida)
W76-12055

MAJOR WATER LAW SYSTEMS: A COMPARATIVE STUDY OF THE UNITED STATES AND SPAIN,
Spessard L. Holland Law Center, Gainesville, Fla.
D. Fernandez.
Available from Eastern Water Law Center, University of Florida, Gainesville, Florida 32611, $1.30. (1976), 26 p.

Descriptors: *Water law, *United States, *Foreign countries, *Administration, *Appropriation, Prior appropriation, Riparian rights, Water resources, Water resources development, Riparian land, Water utilization, Usufructuary right, Legal aspects, Agriculture, Industry.
Identifiers: *Spain, *Comparative water law(US-Spain).

Because an adequate water supply is essential for agriculture and industry, laws governing water have always been a major concern of governments. This paper deals with the water law systems of Spain and the United States, noting similarities and differences, as well as the reasoning and tradition leading to the development of the various systems. A history and explanation are given for riparian rights and riparian land, prior appropriation, and the administrative permit systems in the United States. Spanish water law consists mainly of codified traditional water law, going back as far as Roman times. Semi-arid Spain is subject to uneven rainfall patterns. This, along with industrialization, has created a need for more modern water law. Thus, the trend towards a modern administrative type system in Spain should continue. (Frank-Florida)

RESIDENTIAL DEVELOPMENT A LOOK AT THE REGULATORY CONTROLS OF FLORIDA'S WATER RESOURCES,
Spessard L. Holland Law Center, Gainesville, Fla.
T. S. Hart.
Available from Eastern Water Law Center, University of Florida, Gainesville, Florida 32611, $2.25. June 1976, 45 p.

Descriptors: *Florida, *Legislation, *Administrative decisions, *Permits, *Dredging, Floods, Insurance, Consumptive use, Wetlands, Legal aspects, Waste water disposal, Sewage, Sewage treatment, Environmental effects, Environmental control, State governments.
Identifiers: *Licenses.

The legal problems of small-scale land development are many when it comes to the use and ownership of water resources. Examined here are the problems facing a developer who must comply with a maze of conflicting, overlapping regulations and statutes in Florida. The first step is to determine what kind of water resources are in question; this will direct counsel to the proper body of law. Potential problem areas discussed include: flood insurance; dredge and fill restrictions; consumptive use of fresh water; sewage and waste water disposal; and wetlands legislation. The Environmental Reorganization Act of 1975 is considered helpful since it provides a centralized authority for environmental affairs, as well as delegates decision-making powers to a regional district level. The Act also consolidates all planning operations and permits in Florida. (Frank-Florida)
W76-12057

LANDOWNER'S AUTHORITY TO PROTECT PROPERTY ABOVE ORDINARY HIGH WATER LINE FROM SEASONAL FLOODING,
Spessard L. Holland Law Center, Gainesville, Fla.
L. Strothman.
Available from Eastern Water Law Center, University of Florida, Gainesville, Florida 32611, $1.60. 1976, 32 p.

Descriptors: *Florida, *High water mark, *Floods, *Surface waters, *Flood protection, Judicial review, Earthworks, Embankments, Structures, Dikes, Barriers, Jetties, Levees, Retaining walls, Diversion losses, Diversion structures, Legal aspects.
Identifiers: *Fill permits.

Examined here is whether in Florida one may be liable for damages to another resulting from personal flood protection construction. Generally, under Florida and civil law, one will be liable. A riparian owner does not have the right to build a structure along a stream bank when such structure will cause ordinary flood waters to damage the lands of others. Aside from judicially-imposed requirements there are statutory requirements for state permits, as well as federal requirements. Thus, any landowner seeking to build dikes or other related structures should acquire the necessary local, state and federal permits. (Frank-Florida)
W76-12058

ARIZONA WATER COMMISSION.
Ariz Rev Stat Ann secs 45-501 thru 45-513 (1956), as amended, (Supp 1975).

Descriptors: *Adoption of practices, *Arizona, *Organizations, *Administration, *Administrative agencies, Administrative decisions, Water, Water allocation(Policy), Water resources, Water law, Planning, Projects, Water resources development, State governments, Regulation, Legislation, Water management(Applied).
Identifiers: Administrative regulations.

The terms, composition, qualifications and compensation of the Arizona Water Commission are hereby enacted. Provisions are included for the hiring of state water engineers, executives and other employees and consultants. Powers are delineated, including the right of the Commission to sue, prosecute and defend all rights, and to formulate plans and develop programs for water use.

It shall coordinate its rulings and activities with other state agencies and with the U. S. Secretary of the Interior. Its power of agreement is limited, subject to approval in each instance by the state legislature. All acquired property shall be public and tax-exempt, and gifts of land or money may be accepted. All developers shall submit water supply plans to the Commission. (Frank-Florida).
W76-12059

FLOOD CONTROL.
Ariz Rev Stat Ann secs 45-2301 thru 45-2370 (1956), as amended, (Supp 1975).

Descriptors: *Adoption of practices, *Administrative agencies, *Arizona, *Flood control, *Flood plains, Dam construction, Right-of-way, Rivers, Taxes, Financing, Control, Water control, Flood protection, Building codes, Flood plain zoning, Protection, Water control, Floods, Local governments.

Arizona has enacted flood control legislation including the following provisions: five or more holders of flood-endangered lands may organize a flood control district subject to the approval of the state board of supervisors. Such status shall allow the procurement of assistance from the federal government under the 1948 Flood Control Act, as well as under general acts of Congress. Special laws pertaining to different Arizona municipalities shall take effect, enabling such municipalities to organize flood-control plans under specific projects already planned. In addition, the Arizona Water Commission shall set all regulations for construction and planning in designated floodplain areas, but only after public hearings have been held. Rules and regulations for the creation and operation of special flood control districts are herein enacted, including powers of directors and financial methods of project-funding. Powers to tax and create rights-of-way are also enacted. (Frank-Florida)
W76-12060

STATE WATER AND POWER PLAN.
Ariz. Rev. Stat. Ann. secs 45-2501 thru 45-2501 (Supp 1975).

Descriptors: *Arizona, *Power system operation, *Water resources, *Water supply development, *Construction, Water rates, Developed waters, Electric power, Dams, Aqueducts, Electric power plants, Dam construction, Financing, Eminent domain, Contracts, Control.

Arizona has enacted a comprehensive water and power plan designed to enable the state to use its share of the Colorado River water. The plan specifies projects to be built, ranging from aqueducts to hydroelectric plants. The Arizona Water Commission shall have exclusive power to plan, construct, operate and acquire land regarding this development. It shall also have the power to issue notes and bonds for financial obligations. Eminent domain shall take precedence over private land where water rights are concerned. Furthermore, the Commission shall have the authority to set all water rates and to enter into contracts to effectuate the plan. Finally, the legislation provides that there shall be created a state water and power development fund for purposes of securing all bonds and notes. (Frank-Florida)
W76-12061

GROUND WATERS.
Ariz Rev Stat Ann secs 45-301 thru 45-324 (1956), as amended, (Supp 1975).

Descriptors: *Arizona, *Groundwater, *Groundwater basins, *Groundwater resources, *Drilling, *Wells, Well regulations, Well permits, Penalties(Legal), Permits, Legal aspects, Regulation, Subsurface waters, Water permits, Judicial decisions, Deep wells, Administrative agencies.

Arizona has enacted legislation directing the State Land Department to administer all laws pertaining to groundwater. The Department is authorized to designate, when necessary, groundwater basins and subdivisions. Such designation may also be made in response to a petition of not less than 25 users in a groundwater basin. Other provisions prohibit drilling in a groundwater area without a permit. Drilling in general requires full advance notice to the Department, as well as completion of the drilling within one year. Hearings on designation shall be public with advance notice of at least four weeks. The legislation also regulates wells, providing that wells may be deepened or widened upon a showing that they will be insufficient to irrigate the land within five years of application for the permit to widen or deepen. Completion reports are required. Waste is prohibited; caps and valves may be required. Categories of wells exempt from this act are listed, including those for domestic and stock consumption. Penalties for violation of these provisions include fines up to $250 per offense per day. (Frank-Florida)
W76-12062

WATER RIGHTS (RECOGNITION OF EXISTING RIGHTS AND NONRECOGNITION OF RIPARIAN RIGHTS).
Ariz Const art 17.

Descriptors: *Arizona, *Riparian rights, *Prior appropriation, *Water law, *Constitutional law, State governments, Legislation, History, Judicial decisions, Common law, Diversion, Water rights.

Arizona does not recognize riparian water rights and in fact denies the validity of any such rights in its state constitution. The constitution does, however, recognize and confirm existing rights to use of water. The accompanying 'notes of decisions' to this article provide the historical background for Arizona's position. (Comer-Florida)
W76-12063

DEPARTMENT OF HEALTH SERVICES (FUNCTIONS IN WATER POLLUTION CONTROL).
Ariz Rev Stat Ann secs 36-132, 36-136 (1974).

Descriptors: *Treatment facilities, *Arizona, *Water pollution control, *State governments, *Legislation, Water law, Water pollution, Water treatment, Water pollution sources, Water pollution treatment, Water consumption, Pollutants, Pollution abatement, Swimming, Swimming pools, Public health.

Arizona has enacted legislation providing that the state department of health services shall: supervise the planning, construction, alteration and operation of all sanitary engineering facilities; establish and enforce regulations providing for the classification of water treatment plants, waste water treatment plants and waste water collection systems; certify operating personnel on the basis of training and supervision. Furthermore, the director of the department shall provide regulations regarding water supply production, treatment and distribution, and shall prescribe regulations regarding all aspects of bottled water, as well as ice production and sewage treatment. Finally, the director shall provide regulations to prevent pollution of any public swimming pool or bathing place. (Frank-Florida)

PUBLIC NATURE AND USE OF WATER (APPROPRIATION, BENEFICIAL USE, ADMINISTRATIVE REGULATION).
Ariz Rev Stat Ann secs 45-101 thru 45-109 (1956), as amended, (Supp 1975).

Descriptors: *Arizona, *Public rights, *Appropriation, *Beneficial use, Legislation, Consumptive use, Non-consumptive use, Competing uses, Water allocation(Policy), Water distribution(Applied), Distribution systems, State jurisdiction, Reservoir operation, Surface waters, Groundwater, Penalties(Legal)
Identifiers: Administrative regulations, Licenses, Water rights(Non-riparians).

Arizona has enacted legislation providing that the waters of all sources, flowing streams, underground channels, waste or surplus water, lakes, ponds and springs, belong to the public and are subject to appropriation. Beneficial use shall be the basis of the use of water appropriation rights shall lapse after five years of disuse. General control and supervision of waters is vested in the state land department, including appropriation and use control. The land department is authorized and directed to divide the state into water districts as necessity arises and to appoint a superintendent for each district. The superintendent is responsible for allocating water supply to reservoirs and ditches, controlling reservoirs in scarcity times, regulating distribution to users, and preventing excess use. Penalties are provided by statute for interfering with water allocation and control, using water without authorization, unauthorized diversion, water waste and storage of water without permit. APPROPRIATION OF WATER.
Ariz Rev Stat Ann secs 45-141 thru 45-155 (1956), as amended, (Supp 1975).

Descriptors: *Arizona, *Administrative agencies, *Appropriation, *Beneficial use, Legislation, Permits, Consumptive use, Non-consumptive use, Competing uses, Water allocation(Policy), State jurisdiction, Reservoir operation, Water permits, Administrative decisions.
Identifiers: Administrative regulations, Water rights(Non riparian), Licenses.

Arizona has enacted legislation providing that any person or political entity in the state may appropriate water for beneficial use, including domestic, municipal, irrigation, stock watering, power, wildlife, mining, recreation, personal and commercial use. As between claimants, the person first appropriating shall have the better right. Any one interceding to acquire a water right shall apply to the state land department, including all required information in the application. The department shall approve all proper applications unless the proposed use is detrimental to the interest, welfare and safety of the public, or unless the use conflicts with vested rights. Approval for less than the amount of water requested may be given for substantial reasons. As between conflicting applications where water supplies are insufficient to grant both, approval shall be given depending on relative values to public, with preference for domestic and municipal use first, irrigation and stock watering second, and power industry and mining third. Upon changes and large power plant uses require legislative approval. In addition to appropriation rights this chapter covers reservoir permits and interstate operations. (Comer-Florida)

HYDROLOGICAL DATA--(COLLECTION, RECORDING DISTRIBUTION AND USE).
Alas Stat Ann secs 41.05.010 thru 41.05.030 (1971).

Descriptors: *Alaska, *Hydrologic data, *State governments, *Administrative agencies, *Surveys, Data collections, Measurement, Monitoring, Maps, Well data, Adoption of practices, Administrative decisions, Regulation.

By statute the State of Alaska has declared that systematic collection, recording, evaluation and distribution of all data on the location, quality, and quantity of waters within the State are in the public interest. The Department of Health and Social Services has the duty to collect and record all such data and to publish the same. It also has the duty to require that the results of surveys, pumping tests, flow measurements, physical characteristics and other data collection devices be filed and to enter into any agreements and expend such funds as are necessary. The Department is also empowered to adopt regulations relating to its duties. (Comer-Florida)

REGIONAL WATER DISTRIBUTION DISTRICTS.
Ark Stat Ann secs 21-1403 thru 21-1404 (Cum Supp 1975).

Descriptors: *Arkansas, *Water distribution(Applied), *Water districts, *Water management(Applied), *Water delivery, Legislation, Water control, Water conveyance, Water storage, Water supply, Water demand, Water transfer, Reservoirs, Legal aspects, Water treatment, Bodies of water, Water resources, Water requirements, Regulation, Administration, Zoning, Control systems.

Public regional water distribution districts may be organized in Arkansas for any of the following purposes: (1) the acquisition of water from wells, lakes, rivers, tributaries or streams of or bordering Arkansas, or from existing reservoirs; (2) the acquisition of water, water storage facilities, and the storage of such water in reservoirs; (3) the purification, treatment and processing of said water; (4) the furnishing of said water to persons desiring it; (5) assisting in the installation and operation of the water and transportation facilities; and (6) the transportation and delivery of said water. When water is available for industrial, municipal or agricultural purposes, then one hundred or more qualified voters residing or owning lands in the proposed water district may petition the circuit court in order to establish a water distribution district. The petition must include a description of the territory involved, a statement describing the source of the water, a statement of the necessity for the district, and other appropriate information. DOUNDOULAKIS V TOWN OF HEMPSTEAD (STRICT LIABILITY FOR DAMAGES CAUSED BY FILLING SWAMP RESULTING IN SUBTERRANEAN PERCOLATING WATERS DAMAGING ADJACENT PROPERTY).
381 NYS2d 287-98 (Sup Ct, App Div 1976). 12 p.

Descriptors: *New York, *Land fills, *Damages, *Percolating water, *Subsurface runoff, Groundwater movement, Induced infiltration, Land subsidence, Settlement(Structural), Land forming, Land use, Cities, Legal aspects.
Identifiers: *Absolute liability, *Notice, Fill permits.

Plaintiff landowners brought suit for damages against defendant township, consulting engineer and dredging company for property damage sustained as a result of landfill operations. The township had engaged in filling a swamp which adjoined plaintiffs' property. The method of fill, which involved use of pressurized water caused subterranean percolation of water which undermined plaintiffs' property. The trial court held the township liable, but dismissed the complaints against the other two defendants. On appeal, the Appellate Division held that the township was strictly liable without regard to fault for damage resulting from landfill operations. The appellate court also found that the complaints against the other two defendants were improperly dismissed and that the consulting engineer and dredging company were jointly liable with the township. With regard to timeliness of claims filed by the plaintiffs, the court stated that when the plaintiffs promptly notified the town of danger resulting from the operation, failure to file formal notice of claim until actual damage resulted two years later did not prejudice township's rights or basis for dismissal. BOYER V DEPARTMENT OF HEALTH (THE LATITUDE OF COUNTY REGULATIONS IN REGARD TO WATER PURITY).
381 NYS2d 805-08 (Sup Ct, App Div 1976). 4 p.

Descriptors: *New York, *Water wells, *Septic tanks, *Path of pollutants, *Waste dilution, Sewage disposal, Water levels, Water quality control, Public health, Potable water, Sanitary engineering, Well regulations, Legislation, Water quality standards, Waste water treatment, Water purification, Judicial decisions.
Identifiers: Administrative regulations, Licenses, Water rights(Non riparian).

Plaintiff landowner brought action to vacate approval and certification of a septic system located on neighboring property and to vacate a certificate of occupancy granted to an adjacent property owner. The defendants were the county Department of Health and town Superintendent of Buildings. Plaintiff's property was served by two wells. When the owner of the adjacent property installed a septic system, the distance of the leach field was 84 feet from one of plaintiff's wells. Plaintiff asserted that approval of the septic system was in violation of the state Sanitary Code, which recommends that leach fields be located at least 100 feet from any well. Defendants maintained that the Sanitary Code is not mandatory and that in the area concerned the Code could not be complied with because of local conditions. The trial court dismissed the complaint and the appellate court affirmed, stating that the Sanitary Code recommendations were not mandatory because the code indicates only that the leach field 'should be' 100 feet from wells. The county health departments are given flexibility under the code to deal with local complexities. (Comer-Florida)

KRAVEC V STATE (BRIDGING OF STATE DRAINAGE DITCH TO OBTAIN ACCESS TO INTERIOR LANDS).
382 NYS2d 181-85 (Sup Ct App Div 1976). 5 p.

Descriptors: *New York, *Easements, *Drainage systems, *Right-of-way, *Access routes, Ditches, Bridges, Boundaries(Property), Real property, Condemnation, Eminent domain, Legal aspects, Land tenure.

Plaintiff landowners brought suit for damages claiming that a state drainage easement appropriation denied them access to their land. The land in question was bordered by a prior easement granted to the county and by other lands, not owned by plaintiffs situated on all sides except the side on which the state appropriation was made. The trial court held that while the plaintiffs were barred from access across the county easement, the state drainage easement did not bar access by way of bridge. The Appellate Division court affirmed. The county easement, granted by plaintiffs predecessor, never reserved any property owner rights in the granting instrument and so did not allow access. The state easement, however, reserved the owners' rights to use the property in any way not interfering with easement use. Since the easement appropriation was made for drainage purposes only, the building of a bridge over the drainage ditch to allow access to the property was allowable. (Comer-Florida)
W76-12077

COMMONWEALTH DEPT OF ENVIRONMENTAL RESOURCES V BIERMAN (WATER PERMITS AND FLUORIDATION OF WATER).
354 A2d 48-52 (Pa Com Ct 1976). 5 p.

Descriptors: *Pennsylvania, *Fluoridation, *Fluorides, *Public health, *Administrative decisions, Administrative agencies, Water treatment, Water users, Consumptive use, Domestic water, Potable water, Judicial decisions, Legal review, Environmental effects.
Identifiers: *Environmental impact statement.

Plaintiff residents of town appealed from an Environmental Hearing Board decision to fluoridate town water. The appellate court affirmed the order of the agency, finding that the order was entered on the basis of substantial evidence. The court determined that no legal authority was presented that compelled the board to require an environmental impact statement. With regard to evidence presented at the public hearing, the court determined that the board acted properly in allowing a biochemist to testify to his own research results but erred in admitting certain other evidence. With regard to the effect of other pending actions by the plaintiffs the court determined that the other pending actions were without relevance to the issue of whether the water supply permit should be issued. (Comer-Florida)

UNITED STATES V CITY OF MC ALESTER (AUTHORIZED USE OF LEASED WATERSHED EASEMENTS).
410 F Supp 848-61 (ED Okla. 1976) 14 p.

Descriptors: *Oklahoma, *Indian reservations, *Eminent domain, *Federal jurisdiction, *Easements, Watersheds(Basins), Water works, Reasonable use, Judicial decisions, Land use, Parks, Ranges, Recreation, Crop production, Land tenure, Real property, Legal aspects.

The United States, as trustee of the Choctaw-Chickasaw Nations, brought this action against defendant city to quiet title to certain lands owned by the Indian Nations. By eminent domain proceedings in 1903 the city had acquired an easement over certain lands owned by the Choctaw-Chickasaw Nations. The easement, obtained for purposes of a watershed basin and to erect and maintain a waterworks for city use, was obtained without joining the United States as a party. The Federal District Court held that even though the United States was an indispensable party to the proceedings, the eminent domain action was within the power of the city and resulted in a valid easement. In addition, the court found that the actions of the city in leasing sections of the easement area to utility companies and private individuals were not inconsistent with the easement rights and were authorized uses. (Comer-Florida)

DUCK RIVER PRESERVATION ASSOCIATION V TVA (ENVIRONMENTAL IMPACT STATEMENTS AND USE OF THE RIVER).
410 F Supp 758-68 (ED Tenn 1974). 11 p.

Descriptors: *Tennessee Valley Authority, *Dam construction, *Reservoir sites, *Damsites, *Environmental effects, Mollusks, Cultivated lands, Wildlife habitats, Wildlife conservation, Vegetation effects, Balance of nature, Fish management, Population, Water injury, Psychological aspects, Recreation.
Identifiers: *National Environmental Policy Act, *Environmental impact statements.

Plaintiff conservation association brought action to enjoin construction of a dam and reservoir on the Duck River. The plaintiff alleged insufficient treatment of the effect of the project on agriculture, wildlife, recreation and family relocation in the required environmental impact statement (EIS). The trial court granted the injunction. Although the EIS was sufficiently detailed in most respects and represented a good faith effort, defendant Tennessee Valley Authority failed to disclose the possible extinction of a mollusks species as a result of the dam. In addition the EIS should have revealed the unavoidable losses in agricultural production; offsetting economic industrial development statements were not justification for avoidance. Relocation of families costs, the question of whether a wildlife preserve to protect displaced wildlife would be established, and the fact that recreational demand would exceed opportunities by the year 2000 were other required but omitted issues. In later proceedings the court reviewed an amended EIS submitted by the authority and declared the EIS sufficiently detailed in all areas. The injunction was then withdrawn. (Comer-Florida)
W76-12080

CITIZENS TO SAVE OUR LAND V MCKEE CREEK WATERSHED CONSERV DIST (RIVER CONSERVANCY DISTRICT ACT NOT UNCONSTITUTIONAL DELEGATION OF LEGISLATIVE FUNCTION).
347 N.E.2d 41-8 (Ill App Ct 1975). 8 p.

Descriptors: *Illinois, *Water districts, *Legal aspects, *Legal review, *Judicial decisions, Assessments, Financing, Taxes, Legislation, Districts, Local governments, State governments, Water law, Constitutional law.
Identifiers: *Injunctive relief, Notice.

Plaintiff environmental group joined with land owners to contend that the Illinois River Conservancy District Act was unconstitutional because it provides for the appointment rather than popular election, of the trustees of a river conservancy district. The court disagreed, saying that the defendant Water District is a special unit of government whose trustees perform essentially nonlegislative functions, and therefore can be appointed. The court also refused the plaintiffs' contention that the role of the court in determining boundaries for the district violated the doctrine of separation of powers. After holding that the District had statutory authority to make local improvements by special assessment, the court denied plaintiffs' right to injunctive relief. (Frank-Florida)

BD OF TRUSTEES OF INTERNAL IMPROVEMENT TRUST FUND V BANKERS LIFE AND CAS CO (OWNERS RIGHTS TO FILL AREA BETWEEN OCEAN'S HIGH WATER MARK AND BULKHEAD LINE).
331 So2d 381-5 (1st DCA Fla. 1976). 5 p.

Descriptors: *Boundaries(Property), *Florida, *Landfills, *High water mark, *Bulkhead line, Land, Land use, Land development, Navigable waters, Bulkheads, Coastal structures, Legal aspects, Riparian rights, Water law, Ownership of beds, Beds, State governments, Decision-making, Adjacent land owners, Boundary disputes, Public rights.
Identifiers: Fill permits.

Plaintiff owner of land situated between Lake Worth and the Atlantic Ocean desired to fill and eventually to sell the area between the ordinary high water mark and the bulkhead line established opposite his lands. The plaintiff sought an adjudication of its rights with respect to such filling. The Circuit Court held that such filling was permissible, and defendant trustees appealed. Under the common law the title to the bottoms of all navigable waters was vested in the sovereign. The Butler Act of 1921 divested the state of rights, title and interest to lands covered by water, and operated to vest title to the land created by the lawful filling of such bottoms in the riparian proprietors when the filling was accomplished. In 1957 it became necessary to withdraw the blanket right of uplan

wners to acquire title to adjoining bottoms. How-
ver, the Butler Act remained in force as to those
nds which came within certain conditions. The
irst District Court of Appeal thus concluded that
ie bottoms here involved fell within the condi-
ons; therefore, the plaintiff had the right to make
ie desired fill and thereby acquire title to the
lled land. (Cowart-Florida)

The state of West Virginia prohibits the obstruction of its watercourses by means of a dam or other structure, or by means of felled timber. No person shall fell timber and permit it to remain in a navigable or floatable stream if it obstructs the passage of boats, staves, rafts, ties or timber of any kind. Neither shall any person construct or maintain a dam or other structure in any stream or watercourse if it obstructs the free passage of fish. A suitable fish ladder, way or flume constructed to allow fish to easily ascend or descend must be provided as part of any dam or structure. The director of the department of natural resources must approve the plans for any such fish ladder. If, however, the director determines that there is no substantial fish life in the stream or watercourse, or that installation of the ladder is impracticable, he may permit construction of a dam or other structure without a fish ladder. LOWER CONNECTICUT RIVER CONSERVATION ZONE.
Conn Gen Stat Ann secs 25-102 a thru 25-102 K (1975), as amended, (Supp 1976).

Descriptors: *River basin commissions, *Connecticut, *Connecticut River, *Preservation, *Administrative agencies, Rivers, Running waters, Conservation, Water conservation, Soil conservation, Protection, Natural resources, Legal aspects, Legislation, Zoning, Regulation, Control, Management, Estuaries, Streams, Ecology, Scenic easements, Aesthetics, Water law, Social aspects.

The commissioner of environmental protection, who is generally responsible for preserving the natural resources of the state of Connecticut, is specifically empowered to preserve the scenic, ecological, scientific and historical values of the lower Connecticut River and the towns abutting, and to prevent deterioration of the natural and traditional riverways of the state. In order to effectuate these goals the area to be included in a conservation zone is specified, and a Connecticut River Gateway Commission is established. The commission shall develop minimum standards for preserving the lands and waters in an area by regulating the means of land coverage, frontage, setback, design and building height, the cutting of timber, burning of undergrowth, removal of soil or other earth materials, and the dumping or storing of refuse. The commissioner shall acquire, in the name of the state, interests in lands and waters including scenic easements and development rights. Local planning and zoning commissions with the conservation zone shall revise their ordinances to meet the minimum standards established by the commission. (Cowart-Florida)

PUBLIC WATER SUPPLY SYSTEMS AND WASTEWATER TREATMENT PLANTS.
Ala Code tit 22 secs 140(30) thru 140(45) (Cum Supp 1973).

Descriptors: *Alabama, *Water quality standards, *Water works, *Waste water treatment, *Permits, Legislation, State governments, Administrative agencies, Water quality control, Water resources, Treatment facilities, Standards.
Identifiers: *Licenses, *Certification.

By statute, all Alabama water treatment plants and wastewater distribution treatment plants and water distribution systems are classified by the state health officer. Bases of classification are size, type, character of water treated and the skill and experience that a plant operator must exercise. Persons who supervise the operations of treatment plants and distribution systems must be certified by the state health officer in conjunction with an appointed certification board. Certification is available for a five year term with a renewal allowance. Certificates may be revoked after hearing for fraud in obtaining the certificate, failure to use reasonable care or judgment in operation, and incompetence. Operation of any water treatment plant, water distribution system or wastewater treatment plant without certification is a misdemeanor, punishable by fine or imprisonment. (Comer-Florida)
W76-12094

ELK RIVER DEVELOPMENT AGENCY.
Ala. Code tit 38 secs 131 thru 140 (Cum Supp 1973).

Descriptors: *Alabama, *Legislation, *Groundwater, Basins, *River basin development, *Comprehensive planning, River basin commissions, Watershed management, State governments, Administrative agencies, Water resources development, Water policy, Natural resources, Subsurface waters, Surface waters, Land resources, Water supply development.
Identifiers: *Elk River(Ala).

In order to provide for uniform development of the Alabama portion of the Elk River and to coordinate development of the watershed area with agencies of other states, the Alabama legislature has created the Elk River development agency. The agency shall be a public corporation, incorporated under state law, the members of which shall be appointed by the governor. The agency shall be empowered to: formulate and execute development plans for the area; to acquire land by purchases, lease, gift, condemnation or other means; to enter into contracts for sale of water; to develop reservoirs and shoreline lands for recreational purposes; to sell or lease shoreline lands; and to issue bonds to finance its activities. The agency shall be exempt from state taxation and shall report annually to the governor. (Comer-Florida)

RECORDING OF AERIAL PHOTOGRAPHS OR MAPS.
Ala Code tit 56 secs 42 thru 44 (Cum Supp 1973).

Descriptors: *Watershed management, *Alabama, *Aerial photography, *Maps, *Locating, Sites, Surveys, Terrain analysis, Topography, State governments, High water mark, Water storage.

Alabama probate judges are instructed by statute to receive and record aerial photographs and maps for the purpose of facilitating acquirement of easements by watershed associations, water conservation associations or districts, and any other entity engaged in soil or water conservation. The photographs and maps may have the origin, scale, section and township lines, property lines, high water marks and water storage areas inscribed on them before recording. Irrespective of this election, the photographs and maps must be approved and signed by the county engineer of the area represented before recording. After recording, the photographs and maps may be used as references in instruments of conveyance. (Comer-Florida)

WATER MANAGEMENT DISTRICTS.
Ala Const amend 257.

Descriptors: *Alabama, *Drainage areas, *Flood protection, *Water management(Applied), *Eminent domain, Taxes, Assessments, Electric power production, Hydroelectric power, Wetlands, Drainage, Swamps, State governments, Flood control, Legislation, Drainage systems, Water conservation, Water resources, Water utilization, Land reclamation, Drainage districts, Governments drainage programs, Operating costs.

Alabama has enacted legislation providing that water management districts may be formed to establish improvements for the drainage of wetlands and for flood prevention and control of water within the state. Such districts may be given the power of eminent domain and the power to tax the lands and property within their jurisdiction for the cost of the improvements. No district, however, shall engage in the production, transmission or sale of electric power either directly or indirectly. (Capehart-Florida)

WORKS OF INTERNAL IMPROVEMENT ALONG NAVIGABLE WATERWAYS.
Ala Const amend 275.

Descriptors: *Alabama, *Facilities, *Inland waterways, *Operation and maintenance, Resources development, State governments, Legislation, Bond issues, Docks, Structures, Construction, Financing, Legal aspects, Economics, Costs

Alabama has enacted legislation providing that the state may construct and operate elevators, warehouses, docks, water and rail terminals, and other facilities along navigable streams and waterways to promote the flow of agricultural products within the state and to aid commerce and the use of waterways. Such facilities shall always remain under the control of the state and be part of the state inland waterways facilities. The state may become indebted up to $2,000,000 for these purposes and may issue bonds for repayment of such indebtedness. (Capehart-Florida)

IPALITIES--AUTHORITY TO CHARGE FOR ADMISSION TO MUNICIPAL
y Gen Fla 075-84 (1975). 3 p.

tors: *Florida, *Beaches, *Governmental tions, *Recreational facilities, *Parks, e, Recreation, Local governments, Legal Jurisdiction, Political aspects, Planning, on, Water policy, Management, Control, al use, Municipal water, Riparian rights, propriation, Water rights, Reservation

rs: Water rights(Non riparian), Public trine.

The Attorney General of Florida has stated that municipalities in Florida may charge a fee for admission to a municipal beach. Municipalities have ample authority for acquiring land for park purposes. Furthermore, they may set apart for recreation purposes any municipally owned lands not dedicated or devoted to other inconsistent public uses. It has long been held that the authority to maintain a park carries with it the power to maintain a bathing beach. A municipality may make all reasonable and nondiscriminatory regulations with regard to the control and management of its public parks as are necessary to preserve the public peace and safety, the protection of the property from injury, and to secure to the public the common enjoyment thereof. Therefore, it is generally recognized that a municipality may demand a fee for individual use, provided such fee is reasonable and nondiscriminatory. This authority applies only to municipally owned beaches. Wet-sand beaches between the mean high and mean low water lines are owned by the State and held in trust for all the people. As such, public admission and use of these beaches, in the absence of legislative direction to the contrary, are not subject to municipal regulation and control. (Reinders-Florida)

OIL SPILL PREVENTION AND POLLUTION CONTROL ACT.
1973 Fla Att'y Gen Ann Rep 730-31. 2 p.

Descriptors: *Florida, Pollutant identification, *Federal Water Pollution Control Act, *Oil spills, *Hazards, Legislation, Statutes, Legal aspects, Water law, Water pollution, Chemical wastes, Inorganic compounds, Oil wastes, Beaches, Public health, Safety, Water pollution sources, Water pollution effects, Environmental effects.
Identifiers: *Coastal waters, *Hazardous substances, *Oil Pollution Act.

The Attorney General of Florida has determined that the statutory language 'other hazardous materials' of section 376.031(7), F. S., defining pollutants does not limit the application of the Oil Spill Prevention and Pollution Control Act to oil, gasoline, pesticides, ammonia, chlorine, or their derivatives and by-products. The term 'hazardous materials', in accord with the definition of 'hazardous substances' presented in the Federal Water Pollution Control Act, includes elements or compounds which when discharged in any quantity present an imminent and substantial danger to the public health or welfare. 'Public welfare' includes, but is not limited to, fish, shellfish, wildlife, shorelines, and beaches. As of November, 1973, the Florida Department of Natural Resources has not interpreted the statute regarding the definition of pollutants or hazardous substances. (Reinders-Florida)

BANKERS LIFE AND CASUALTY COMPANY V CALLAWAY (EXTENSION CRITERIA FOR DREDGE AND FILL PERMITS UNDER THE RIVERS AND HARBORS ACT).
530 F2d 625-36 (5th Cir 1976). 12 p.

Descriptors: *Permits, *Dredging, *Administrative decisions, *Florida, Regulation, Rivers and Harbors Act, Conservation, Ecology, Legal review, Administrative agencies, Control, Local governments, Lake basins, Legal aspects.
Identifiers: *Fill permits.

Plaintiff dredging company sought a declaration that defendant Army Corps of Engineers had unreasonably delayed extension of the company's dredge and fill permit, that the permit never expired, and that hearing on the renewal application should have been granted. The plaintiff's original permit was extended; however, the defendant refused a second extension. In addition, the defendant had required a local fill permit in accordance with Florida law. This the plaintiff had also failed to procure. The plaintiff relied on section 558(c) of the Administrative Procedures Act (APA) which states that a license for continuing activity does not expire until a final ruling. After a lower court dismissed the suit as unripe, the court of appeals reversed, holding that the defendant was correct in waiting for the local permit to be approved before granting renewal. Furthermore, plaintiff's permit by its language had expired. The court then went on to rule that a renewal hearing will be granted only after a sanction has been placed on the licensee. ENVIRONMENTAL CONSERVATION (WATER POLLUTION CONTROL).
Alas Stat Ann secs 46.03.010 thru 46.03.710 thru 46.03.130, 46.03.710 thru 46.03.900 (1971), as amended, (Supp 1975).

Descriptors: *Alaska, *Legislation, *Administrative agencies, *Water quality standards, *Water resources development, Water quality control, Pollution abatement, Water pollution control, Water policy, Waste water disposal, Permits, Oil pollution, Pesticide removal, Air pollution.
Identifiers: Administrative regulations, Nuisance(Legal aspects).

To carry out state policy in the protection, improvement and conservation of natural resources, the Department of Environmental Conservation is empowered with all necessary powers to formulate and annually review a statewide environmental plan for the management and protection of the environment. With specific reference to water pollution control the department has the jurisdiction to prevent and abate pollution. The department shall develop a comprehensive plan for water pollution control and, after public hearing, may adopt and publish water quality standards, and pollution standards. The department may require submission of plans for sewage and industrial waste disposal or treatment. No disposal of solid or liquid commercial waste may be made without a permit obtained from the department in accordance with specified procedure. The department may also terminate or modify permits for proper reasons and may issue compliance orders. penalties are provided for certain prohibited actions, including oil pollution, ballast water discharge, use of certain pesticides and construction of certain sewage plants. (Comer-Florida)

UNITED STATES V KENNEBEC LOG DRIVING COMPANY (RIVER AND HARBORS ACT APPLICABLE TO LOG DRIVING ACTIVITY).
530 F2d 446-50 (1st Cir 1976). 5 p.

Descriptors: *Maine, *Rivers and Harbors Act, *Lumbering, *Wood wastes, *Pollutants, *Permits, Rivers, Legislation, Water pollution, Legal aspects, Control, Bark, Waste disposal, Disposal, Water pollution sources, Judicial decisions.
Identifiers: *Injunctive relief, Kennebec River(Me).

Plaintiff United States sought an injunction against defendant log drivers to stop future log driving, as well as an order requiring removal of past log refuse from the Kennebec River. The defendants said that section 13 of the Rivers and Harbors Act did not apply to them, and that enforcement was within the discretion of the Secretary of the Army. The District Court held that peeled bark and logs were forbidden refuse under the Act. On appeal the First Circuit Court held that the Act applies to log driving, and that refuse discharge permits must be obtained before such activities may be conducted. It further affirmed the District Court in saying that section 13 did not apply only to refuse affecting navigation. The issue of retrospective relief was remanded to the

District Court, as defendants claimed there should be no clean-up responsibilities for actions taken under a good faith construction of the law. (Frank-Florida)

GRAIN PROCESSING CORP V TRAIN (SINGLE NUMBER EFFLUENT STANDARD AS ARBITRARY--MUST HAVE A RANGE OF NUMBERS).
407 F Supp 96-107 (SD Iowa 1976). 12 p, 2 tab.

Descriptors: *Administrative decisions, *Water quality standards, Biochemical oxygen demand, Suspended solids, Hydrogen ion concentration, *Federal Water Pollution Control Act, Effluents, Industrial wastes, Water pollution control, Water pollution sources, Water quality, Mills, Water policy, Permits, Regulation, Administrative agencies, *Iowa.
Identifiers: *FWPCA Amendments of 1972, *Administrative regulations, *Effluent limitations.

Plaintiffs, millers in the corn wet milling industry, brought this action to review effluent limitation guidelines promulgated by the Environmental Protection Agency (EPA). The plaintiffs alleged that regulations for existing point sources in the industry were promulgated beyond the statutory authority granted the EPA and that the EPA acted arbitrarily and capriciously in promulgation. The Federal District Court held for the plaintiffs. The court found that in issuing effluent limitation guidelines the EPA reasonably divided grain milling into six subcategories; however, the EPA did not satisfy section 304(b)(1)(B) of the Federal Water Pollution Control Act amendments which requires that the EPA specify factors to be taken into account when promulgating guidelines. The EPA was therefore found to have acted arbitrarily and capriciously and in excess of statutory authority in failing to specify point source factors. In addition, the EPA guidelines, being single number, rather than range, were held to be invalid since they did not provide for circumstances within each point source. On remand, the EPA was directed to use current cost figures rather than 1971 figures when determining the best practicable control technology currently available. (Comer-Florida)
W76-12109

UNITED STATES V ZORGER (CONSTRUCTION OF THE LANGUAGE IN A DEED GRANTING A FLOWAGE EASEMENT).
407 F Supp 25-31 (WD Pa 1976). 7 p.

Descriptors: *Administrative decisions, *Pennsylvania, *Easements, *Land tenure, *Land use, Land development, Judicial decisions, Flood routing, Flood control, Right-of-way, Camp sites, Recreation facilities, Recreation wastes.
Identifiers: Estoppel.

The United States brought this action against defendant landowners to enjoin the maintenance of a campground in an area encumbered by a government flowage easement. The government alleged that the deed of easement prohibits construction of structures for human habitation. The defendants alleged that a governmental official orally represented that the government would grant permission for the campground. The Federal District Court granted the injunction on the basis that oral representations cannot as a matter of law extinguish deed restrictions. Under Pennsylvania law servitudes created by deed can be extinguished only by deed, written instrument or by operation of law. In addition, the government is not estopped because of representations made by an agent without authority. The fact that the campground accommodated tents, mobile homes, campers and trailers is no avoidance of the restriction. Such units are clearly devices of human habitation maintained upon the property in violation of express deed language.
W76-12110

COMMONWEALTH V. WESTCOTT (SUBMERGED LANDS ACT DEFINITION OF NATURAL RESOURCES AS INCLUDING FISH, MEANING THE POWER TO PRESERVE AND REGULATE).
344 NE2d 411-19 (Mass. 1976). 19 p.

Descriptors: *Massachusetts, *Submerged Lands Act, *Constitutional law, *Fishing, *Fish migration, Fish management, Ownership of beds, Preferences(Water rights), Natural resources, Navigable waters, Anadromous fish, Catadromous fish, Fishing gear, Nets, Commercial fishing, Sport fishing, Fish conservation, Regulation.
Identifiers: *Coastal waters, Water rights(Non-riparians).

Defendant resident of Rhode Island was arrested and charged with dragging for fish in Massachusetts waters during the summer months. Because the statutory prohibition and criminal liability was directed only against Massachusetts non-residents, the defendant challenged the statute on constitutional grounds. The Supreme Judicial Court of Massachusetts, on direct appeal, held that the imposition of different treatment for resident on non-resident fisherman rendered the statute unconstitutional. The ownership theory under which a state claims ownership of water resources has never been made applicable to migratory fish but is limited to statutory resources such as oysters. The Submerged Lands Act of 1953, while purporting to grant states title to natural resources within state navigable waters, actually confirms only pre-existing state rights. The Act does not enlarge the rights of states, but merely reserves to states regulatory and preservation power. States cannot, therefore, discriminate against non-residents on the basis of natural resource ownership of residents. (Comer-Florida)

CENTRAL ILLINOIS PUBLIC SERVICE CO. V. EPA (THE TAKING ISSUE AND EFFLUENT STANDARDS).
344 NE2d 229-39 (Ill. Ct. App. 1976). 11 p.

Descriptors: *Illinois, *Administrative agencies, *Water rights(Riparians), *Lakes, *Legislation, *Constitutional law, Eminent domain, Permits, Water quality control, *Water pollution control, State jurisdiction, Water rights, Artificial lakes, Surface waters, Discharge(Water), Influent streams, Effluent streams, Water policy, Water permits, Water utilization, Heated water, Water pollution sources, Water pollution treatment.
Identifiers: *Administrative regulations, Licenses.

Plaintiff Illinois public utility brought this action challenging the power of the Environmental Protection Agency and the state pollution control board to regulate discharges into an artificially created lake located on private property. The appellate court affirmed the agency powers, holding that the state pollution control board is granted statutory powers to administer the pollution control laws of the state. Under the law, discharge into any waters of the state is covered since 'waters' is defined to include all water accumulations, including artificial and private ones. This definition gave the board power to control discharge into plaintiff's lake. Furthermore, such regulation power was not an unconstitutional taking of personal property without due process. The plaintiff's property was not appropriated for public use; its use was merely regulated by laws enacted to protect the general health and welfare. The Court also held that the agency's regulation of discharges into the lake was not a denial of equal protection. (Comer-Florida)

LANE V UNITED STATES (DUTY OF CARE OF COAST GUARD TO MARK SUBMERGED WRECKS).
529 F2d 175-80 (4th Cir 1975). 6 p.

Descriptors: *Obstruction to flow, *Boats, *Hazards, *Navigable rivers, *Warning systems, Federal government, Administrative agencies, Navigation, Navigable waters, Judicial decisions, Charts, Rivers, Channels, Barges, Accidents, Damages, Negligence, Legal aspects, Drowned(Submerged).
Identifiers: *Navigation obstructions, Notice, Intracoastal waterway.

Plaintiff boat owner brought suit in admiralty against defendant United States for failure to mark a sunken wreck. The plaintiff was operating his vessel in the Intracoastal Waterway when he struck an unmarked sunken barge and his own boat sank. The plaintiff contended that the federal government was responsible for marking the wreck. The United States contended that its duty to mark the wreck was discretionary; furthermore that duty was satisfied by publication of a navigational chart showing the location of the wreck. The trial court ruled that the United States had a mandatory duty either to mark the wreck or to remove it. The Fourth Circuit Court of Appeals held that the duty to mark unremoved wrecks in navigable waters is discretionary rather than mandatory and remanded the case to determine if there had been an abuse of discretionary authority. The court also stated that wrecks which constitute hazards to navigation must be marked physically; publication of a chart is not sufficient. (Capehart-Florida)

STATE BOARD OF TRUSTEES OF THE INTERNAL IMPROVEMENT TRUST FUND V SEA-AIR ESTATES, INC (DEFINITION OF ARTIFICIALLY CREATED NAVIGABLE WATERS).
327 So2d 823-25 (3d DCA Fla 1976). 3 p.

Descriptors: *Florida, *Permits, *Artificial watercourses, *Excavation, *Navigable waters, Channels, Legal aspects, Legal review, Judicial decisions, Jurisdiction, Regulation, State governments, Channel improvement, Canals, Legislation, Watercourses(Legal aspects), Canal construction, Dredging, Administrative agencies.

Plaintiff state agency sought to enjoin defendant landowners to replace fill excavated from the defendants' land. The defendants owned property on which there were several artificially created navigable waterways. The defendants had excavated land in the waterways by 'pulling the plugs' between the channels. The plaintiff contended that the waterways were not artificially created and that a permit was required for such excavation whether the waterways were artificial or naturally created. The trial court found for the defendants and the Florida Third District Court of Appeal affirmed holding that the plaintiff had no regulatory jurisdiction over excavation conducted wholly within artificially created navigable waters. The court distinguished the defendants' action of removing land in an artificially created waterway from the restricted actions of constructing islands or adding to or extending lands into either artificial or natural navigable waterways. NATURAL RESOURCES (CONSERVATION POLICY, DEVELOPMENT, PUBLIC RIGHTS--ALL STATE NATURAL RESOURCES).
Alas Const art 8, secs 1 thru 18.

Descriptors: *Alaska, *Natural resources, *Public rights, *Public access, *Fisheries, *Sustained yield, Mineral water, Fish, Surface waters, Subsurface waters, Beds, Tidal marshes, Navigable waters.

Alaska has enacted legislation providing that the state policy is to encourage the settlement of its land and development of resources in a means consistent with the public interest. Accordingly, whenever occurring in their natural state all waters, fish and wildlife are reserved for common use. All lands including submerged and tidal lands are in the public domain and the legislature may select areas of value to be reserved for the use of the people. All other lands may be sold or granted. Fish and other replenishable resources must be maintained on the sustained yield principle and no exclusive right of fishery may be created in the natural waters of the state. Free access to navigable and public waters may not be denied any citizen of the United States or resident of the state. All surface and subsurface waters are reserved to the people for common use but are subject to appropriation. Mineral and medicinal waters are not reserved. (Comer-Florida)

CONSERVANCY LAW OF COLORADO -- FLOOD CONTROL.
Colo. Rev. Stat. Ann. secs 37-1-101 through 37-3-117 (1973).

Descriptors: *Colorado, *Flood control, *Channel improvement, *Flood protection, *River regulation, Legislation, Flood damage, Multi-purpose projects, Water management(Applied), Legal aspects, Overflow, Floods, Streamflow, Water injury, Warning systems, Diversion structures, Water conservation, Water districts, Water utilization, Water law.
Identifiers: Petition, Conservancy district.

For purposes of flood control, regulation of stream channels, regulation of the flow of streams, and the control of watercourses, the district court in any county in Colorado has jurisdiction to establish a conservancy district. Subsidiary purposes of the established district are conservation, development, utilization and disposal of water for agricultural, municipal and industrial uses. The initial step in the organization of a conservancy district is the filing of a petition in the office of the clerk of the court vested with jurisdiction. Upon a hearing the court shall adjudicate the questions of jurisdiction and organization, and enter a decree incorporating the district. The court then appoints a board of directors of the district. The board is given a general grant of power in order to protect life and property when it is threatened by the normal flow, flood or overflow waters of any natural watercourse in the district. (Cowart-Florida)
W76-12122

WATER CONSERVANCY ACT.
Colo Rev Stat Ann 37-45-101 thru 37-45-120, 37-45-131 thru 37-45-135 (1973).

Descriptors: *Colorado, *Legislation, *Conservation, *Water resources, *Water districts, Water law, State governments, Water resources development, Groundwater, Eminent domain, Appropriation, Compensation, Legal aspects, Right-of-way, Condemnation, Water rights.

Colorado has enacted legislation to assist in the conservation of Colorado water resources by providing for the creation of water conservancy districts. Before a district may be created, a petition with the signatures of no fewer than 1500 owners of irrigated land situated within the territory to be organized must be presented to the clerk of the proper district court. Provisions are made for the notice and protest of hearings concerning the petition. Once the district is created, a board of directors shall be appointed by the court. This board shall have the power to: take in any legal manner all property necessary; dispose of and allocate water, water rights, and sources of supply; construct, operate or control all works necessary for the full exercise of its powers; exercise eminent domain; contract with any government or agency; fix water rates; adopt plans for district works; borrow money and incur indebtedness; acquire rights-of-way; and organize subdistricts. (Frank-Florida)
W76-12123

WATER RIGHTS--GENERALLY.
Colo Rev Stat Ann sec 37-81-101 thru 37-85-102 (1973).

Descriptors: *Colorado, *Water utilization, *Water rights, *Water resources, *Legislation, Ditches, Flumes, Streams, Weirs, State governments, Appropiation,Water law, Conservation, Water conservation, Penalties(Legal).

Colorado has enacted legislation making it unlawful to remove, by any means, water from the state. The state engineer shall enforce this provision by bringing all violations to the attention of the attorney general. All water is public property and is subject to appropriation, including natural springwater. Appropriators who introduce foreign water into a stream system have the right to make successive uses of such water. In addition, any person may divert water from one public stream into another and take out the same amount of water again. Water may also be loaned as between owners. Owners shall keep in repair all ditches, as well as provide for tail ditches where appropriate. Where a ditch crosses a highway, a bridge shall be built within three days. No excess of water shall be used during the summer season whatsoever. Measuring weirs and gauge rods shall be used on all ditches, canals, flumes or reservoirs. Where reservoirs are situated in the course of streams, water shall be released in quantities sufficient to prevent evaporation from depleting the natural flow of the stream. Finally, failure to deliver water is a misdemeanor, and taking too much will make one liable for actual damages. (Frank-Florida)
W76-12124

RESERVOIRS AND WATERWAYS.
Colo Rev Stat Ann sec 37-86-101 thru 37-89-104 (1973).

Descriptors: *Colorado, Appropriation, *Water use, *Legislation, *Rivers, Ditches, Flumes, Streams, Water conservation, Condemnation, Eminent domain, Reservoir storage, Reservoir releases, Reservoirs, Water law, Liability.

Colorado has enacted legislation providing that owners of water rights are entitled to rights-of-way through lands which lie between the points of use and diversion. This shall include only those structures, such as pipelines, necessary for the purpose required. There also exists a private right of condemnation; but no land shall be burdened with more than one ditch within the owner's consent. Furthermore, the shortest route and the most uniform grade possible must be used. The owner of the ditch must permit enlargement. Lateral ditch owners, when holding 60% or more of the land area served by one ditch, may incorporate. They may also, under eminent domain, condemn the remaining 40% provided just compensation is paid. Where there is a shortage, water will be appropriated on a pro-rata basis according to each person's entitlement. Reservoirs are permitted for storage of unappropriated water only. Water may be conducted into natural streams, but notice of release must be given to the proper irrigation division. Owners shall be liable for all leakage and overflow damages caused by escaping reservoir waters. Finally, the state engineer shall set maximum storage levels. (Frank-Florida)
W76-12125

UNDERGROUND WATER.
Colo Rev Stat Ann sec 37-90-101 thru 37-90-141 (1973).

Descriptors: *Appropriation, *Colorado, *Legislation, *Underground, *Underground streams, *Water sources, Water resources, Beneficial use, State governments, Wells, Aquifers, Drilling, Prior appropriation, Groundwater resources, Groundwater availability.

Colorado has enacted legislation controlling the appropriation of all groundwaters in the state. To assist in the appropriation procedures, a groundwater commission is established. Its powers include: designation of groundwater basins; issuance of appropriation permits; determination of priority of appropriation; limitation of withdrawal where necessary; establishment of reasonable pumping levels; and the issuance of well construction permits. Also created are groundwater management districts and water conservation boards, whose duties are described. All hearings by these boards and commissions shall be public, and provisions are made for due notice to the public. Management districts shall have the power to finance through bond issuance, and such regulations are included. Finally, provisions are given for procedures governing the inclusion or exclusion of any lands in such management districts. (Frank-Florida)
W76-12126

WATER WELL AND PUMP INSTALLATION CONTRACTORS.
Colo Rev Stat Ann sec 37-91-101 thru 37-91-112 (1973).

Descriptors: *Colorado, *Legislation, *Water sources, *Wells, Pumping, Pump testing, Aquifer, Permits, Penalties(Legal), Artesian wells, State governments, State jurisdiction, Drainage wells, Water resources.

Colorado has enacted legislation creating a state board of examiners of water well and pump installation contractors. The board shall: exercise authority over construction and installation of all wells; adopt rules to effectuate this article; examine and control the licenses of applicants; and conduct hearings with respect to license denial, revocation or suspension. Licensing requirements are subsequently stated, as well as basic principles and minimum standards for the construction, repair or abandonment of all wells and pumping equipment. (Frank-Florida).
W76-12127

RIVER BASIN AUTHORITIES.
Colo Rev Stat Ann secs 37-93-101 thru 37-93-108 (1973).

Descriptors: *Colorado, *River basin development, *River basin commissions, *Condemnation, *Water resources, Right-of-way, Water utilization, Water supply, Water supply development, Water storage, Water transfer, Pipes, Pipelines, Taxes, Tax rates.

Colorado has enacted legislation creating thirteen river basin authorities to promote stability of ground and surface water supplies. Groundwater basins are made exclusive of river basins. Each basin authority has the power to: construct and operate all water transport and storage facilities; condemn lands for such constructions; raise revenue by taxing real property; tax each water user up to three cents per acre-foot; issue bonds payable from ad valorem taxes on property; appropriate all unappropriated waters; establish standards for water utilization; and enter contracts with other river basin authorities. Denver is made exempt from inclusion in any basin authority. Finally, no area served by an urban water supply shall be included in a basin authority without its consent. (Frank-Florida)
W76-12128

DITCH AND RESERVOIR COMPANIES (RIGHTS AND DUTIES).
Colo Rev Stat Ann sec 7-42-101 thru 7-42-117 (1973).

Descriptors: *Colorado, *Ditches, *Reservoirs, *Legislation, *Water rates, Water law, Construction, Right-of-way, Repairing, Permits, Canals, Channels, Excavation, Water contracts, Water conveyance, Adoption of practices, Administrative agencies.
Identifiers: Notice

Colorado has enacted legislation establishing rules and regulations for ditch and reservoir companies in the state. Work on any project shall not take more than two years, nor commence more than 90 days after issuance of a certificate. Exceptions to this provision are listed. A right of way shall be granted following the line named in the certificate, subject only to prior rights still in existence. Stock purchase and assessment rules are stated. Preference for water use shall be given to the class named in the certificate when there is a shortage. Rates shall be fixed by the board of county commissioners. Each company shall keep its ditches in good repair. Corporate rules pertaining to notice, extension and certification are also given. (Frank-Florida)
W76-12129

POWERS AND FUNCTIONS OF CITIES AND TOWNS (WATER RELATED).
Colo Rev Stat Ann sec 31-12-101(22) thru (24),(35),(38) thru (40),(75),(77) thru (79) (1973).

Descriptors: *Treatment facilities, *Colorado, *Municipal water, *Legislation, *Local governments, Water resources, Canals, Reservoirs, Eminent domain, Sewers, Sewage treatment, Taxes, Financing, Condemnation, Condemnation value, Water pollution treatment.

Colorado has enacted legislation providing that town and city governing bodies shall have the right to construct, maintain and assess taxes for sewers and watermains, alter in any way all watercourses and provide for water purification and construction of water pollution facilities. They may also issue bonds for such construction, enter into contracts with industry for the provision of such services or to extend treatment works partially outside the municipality. In the last instance, jurisdiction shall extend for five miles above the point from which water is taken for treatment. Also, governing bodies of cities and towns are given power to: build and levy taxes on wells and reservoirs; charge for the supply of water to outside consumers; regulate the construction of all water pipes and facilities; condemn land for sewers and pipes; take private water upon payment of just compensation; and finally, to pass ordinances necessary to enforce all granted powers. (Frank-Florida)
W76-12130

WATER AND WASTEWATER TREATMENT PLANT OPERATORS.
Colo Rev Stat Ann secs 25-9-101 thru 25-9-1 (1973).

Descriptors: *Operation and maintenance, *Treatment facilities, *Colorado, *Waste treatment, *Waste water(Pollution), Water pollution control, Water pollution, Water quality, Water reuse, Pollutants, Treatment, Management, Operations, Standards, Water pollution treatment, Penalties(Legal).

Colorado has enacted legislation providing that waste and wastewater treatment plant operators must meet minimum standards of knowledge and experience. Operation by anyone not so qualified shall result in penalties both to the plant and to the operator. A plant operator's certification board shall consist of nine members, and its duties include: the setting forth of requirements for application; administration of certificates; promotion of training schools; and the establishment of five classes of operators in both the waste and water categories. Payment shall be for expenses only. Requirements for certification in each class are enumerated. The application and certification fees are also listed. (Frank-Florida)

6G. Ecologic Impact Of Water Development

ENVIRONMENTAL ASSESSMENT: A PLANNING TOOL,
Ontario Ministry of the Environment, Toronto. Environmental Approvals Branch.
M. E. Plewes.
In: Annual Conference Proceedings of the Ontario Section of the American Water Works Association, Pollution Control Association of Ontario, and Ontario Municipal Water Association, April 20-23, 1975. Toronto, Ontario, p 154-160.

Descriptors: *Planning, *Environmental effects, *Legislation, *Canada, *Legal aspects, *Assessments, Evaluation, Environmental control, Construction, Project planning.
Identifiers: Environmental impact statements, Ontario, Environmental Assessment Act.

The use of environmental assessment as a planning tool is discussed along with the development of Ontario's Environmental Assessment Act. The need for environmental assessment in Ontario has become apparent as a result of increased public interest in the environmental impacts of large-scale projects involving river diversions, sewage treatment plants, sewers, pipelines, and other construction activities. Recently, there has been a gradual shift in emphasis away from after-the-fact controls and towards restorative and preventive measures by environmental protection

organizations in Ontario. The Environmental Assessment Act is an example of this change in emphasis. The Act requires proponents of designated undertakings to submit to the Minister of the Environment an environmental assessment of the project which must be accepted by the Minister prior to project initiation. A METHODOLOGY FOR EVALUATING DEVELOPMENT-ENVIRONMENTAL CONFLICTS ON WILD AND SCENIC RIVERS,
Idaho Univ., Moscow. Dept. of Agricultural Economics.
E. L. Michalson, and J. R. Hamilton.
Water Resources Bulletin, Vol. 11, No. 6, p 1149-1156, December 1975. 2 fig, 3 tab, 4 ref. OWRT B-014-IDA(IT).

Descriptors: *Water resources development, *Environment, *Wild rivers, Methodology, Evaluation, Cost-benefit ratio, Hydroelectric power, Recreation demand, Irrigation, Economics, Growth rates, *Idaho.
Identifiers: *Salmon River(Idaho).

A methodology is developed for examining the environmental and developmental conflicts inherent in the classification process of a wild river. First, inventory studies of resources are made to determine areas of concern affecting wild and scenic river status. Second, the resource uses for the river are evaluated in order to narrow the range of relevant resource uses. Finally, an economic comparison of use tradeoffs is made; the alternatives include: (1)a wild river; (2)a partially developed river; and (3)a completely developed river. The comparisons are based on estimated consumer surplus values resulting from hydroelectric power and outdoor recreation alternative uses of the Salmon River. In examining the alternatives for the Salmon River, the procedures outlined in the United States Water Resources Council's Establishment of Principles and Standards for Planning Water and Related Land Resources is generally followed. Final comparisons show that hydroelectric development had greater net benefits than outdoor recreation at up to a three percent recreation growth rate. When recreation use grew at a faster rate, recreation had a considerable margin of net benefits in its favor. (Bell-Cornell)

ENVIRONMENTAL INVENTORY AND ASSESSMENT OF NAVIGATION POOLS 24, 25, AND 26 UPPER MISSISSIPPI AND LOWER ILLINOIS RIVERS; FLOODPLAIN ANIMALS AND THEIR HABITATS,
Southern Illinois Univ., Carbondal, Cooperative Wildlife Research Lab.
V. A. Terpening, J. R. Nawrot, M. J. Sweet, and D. L. Damrau.
Available from the National Technical Information Service, Springfield, Va 22161, as ADA-009 781, $9.25 in paper copy, $3.00 in microfiche. Contract Report Y-75-2, April 1975. 270 p, 2 fig, 25 tab, 4 map, 168 ref, 8 append. Army DACW39-74-0107.

Descriptors: *Environment, *Surveys, *Animal populations, *Mississippi River basin, Ecology, Rivers, Navigable rivers, Habitats, Wildlife habitats, Wildlife, Sampling, On-site investigations, Mammals, Birds, Reptiles, Animal diseases, Environmental effects, Flooding, Flood plains.
Identifiers: *Illinois River, Environmental inventories.

An inventory of the animals and their habitats was conducted in the lower Illinois River floodplain between Grafton and Beardstown, Illinois, and in the upper Mississippi floodplain between Alton, Illinois, and Hannibal, Missouri, to provide data for an environmental impact statement. Seven habitats were distinguished in the unprotected floodplain. A total of 49 species of mammals, 286 species of birds, and 81 species and subspecies of amphibians and reptiles were expected to exist in the study area. Seven wildlife-related diseases may occur in the study area; none were of major public health concern. In the counties of the study area, hunting and trapping were valued at an estimated $6.8 million per year; wildlife-oriented, nonconsumptive recreation in the Mark Twain Refuge within the study area was valued at about $3.7 million per year. Four wildlife refuges and management areas covering more than 54,000 acres were located in the study area. Floodplain flora and fauna remain relatively unaffected by floods of short duration, but prolonged periods of flooding may be detrimental. Four maintenance activities are conducted in the study area: pool regulation, bank revetment, wing dike maintenance, and dredging. Operation and maintenance activities in combination with levees and agricultural siltation will ultimately reduce the ecological diversity of the unprotected floodplain. (Sims-ISWS)

Descriptors: *Environment, *Surveys, *Vegetation, *Mississippi River, *Mississippi River basin, Ecology, Rivers, Navigable rivers, Forests, Wetlands, Flood plains, Deciduous forests, Deciduous trees, Trees, Maple trees, Willow trees, Oak trees, Cottonwoods, Hickory trees, Ash trees, Mapping, Maps, Vegetation effects, Environmental effects.
Identifiers: *Illinois River, Environmental inventories.

The purpose of this study was to provide a vegetation map and descriptions of vegetational types and their successional patterns to be used in an environmental impact analysis of the effects of maintenance and operation of the nine-foot navigation channel in Pools 24, 25, and 26 on the Upper Mississippi and Lower Illinois Rivers. Seven vegetation types were described after field examination of 116 stands: two non-forest types, old fields and wetlands; and five forest types, willow, silver maple-cottonwood, silver maple-cottonwood-pin oak, pin oak, and oak-hickory. All of these types were mapped with the exception of old fields, which were omitted because they are often subject to cultivation after a short period of abandonment. The silver maple-cottonwood community was found to be the most extensive type. Analysis of successional trends indicated that ash (Fraxinus spp.) and American elm (Ulmus americana) may become more important in many of the silver maple forests and that pin oak forests may also replace them particularly in areas protected from flooding by levees. The existing forest patterns are related to geomorphology and prediction of future plant communities rests strongly on the prediction of the geomorphic environment. The maintenance and operation of the 9-foot navigation channel has potential ecological effects. This research began the study of those effects on limited sections of the Mississippi and Illinois Rivers, but what must be done now is to examine the Upper Mississippi River Basin as a whole by an integrated team of biologists, geologists, and social scientists. Descriptors: *Decision making, *Mathematical models, *Systems analysis, Water resources Management, Environment, Water policy.
Identifiers: Credibility.

The primary role of a decision maker is to make right decisions on the basis of available information and within the allowable time and resource constraints. The two basic types of models used for decision making, technocratic and incremental, are discussed, and so are the common criteria of the decision-making process in a real world. The intensity and diversity of demands on our limited water resources have increased to such an extent that decision makers find it increasingly difficult to consistently attain the needed flexibility and dexterity. The average decision maker has been provided with few, if any, new tools and concepts in the past several decades. One of these few techniques is systems analysis. But modelling lacks credibility with the policy makers. The several reasons for this 'credibility gap' are discussed in depth. Ten basic rules are suggested as guidelines for realistic model development. The positive and negative aspects of modelling for decision making are discussed. Appropriate remedies are suggested to improve the image of modelling in the eyes of the decision maker which will reduce the proliferation of unvalidated untested and unuseful models. In conclusion, even though some of our current models in this field are rather crude, the issue, in the final analysis, is very definitely on the side of having a model, even a crude one, against having no model at all. Vol 3 for sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402 Price $2.65. April 1974. 106 p, 22 fig, 16 tab, 22 ref, append.

Descriptors: *Water quality control, *Environmental effects, *Resources development, Assessment, Continental Shelf, Earthquakes, Tsunamis, Climates, Soil stability, Oil pollution, Oil spills, Exploration, Production, Storage, Transportation, Hazards, Pipelines.
Identifiers: *Outer Continental Shelf, *Offshore technology, Underwater storage, Tankers, Floating storage, Gulf of Alaska, U. S. East Coast.

This report is the first part of Volume 4 which is part of a 5 volume set. The effects of each of the natural elements and the volume of oil at risk is summarized. Severe storms are assessed as 'moderate' threats in the case of afloat and underwater storage because of the volume of oil that is at risk. Earthquakes vibrations seriously threaten underwater storage. Whether acceptable designs can be developed that will be able to withstand severe Alaskan earthquakes will require further study. In fact it may be very difficult to develop designs that will withstand the relatively infrequent Atlantic earthquakes. Since such a large volume of oil is a risk, earthquake vibrations have been classified 'serious' threats with respect to underwater storage. Soil stability is also a serious factor in underwater storage. The stability of soil beds (which also includes faulting) will also threaten pipelines. Tsunamis are a serious hazard to both underwater storage and tankers moored at fixed berths. In both cases the volume of oil at risk is large. Furthermore, in the case of the tanker, the oil would be released at the shoreline, an area considered to be the most ecologically sensitive. Use of pipeline and ashore storage is evaluated best for both the Atlantic OCS and the Gulf of Alaska. In the Alaskan area tanker transport will be required. A floating moor rather than fixed berths represents a lesser risk of massive oil spillage. In the event that soil conditions are such that pipelines will be exposed to unacceptable risks, floating storage may be an acceptable alternate for use in both OCS areas. OCS OIL AND GAS - AN ENVIRONMENTAL ASSESSMENT. A REPORT TO THE PRESIDENT BY THE COUNCIL ON ENVIRONMENTAL QUALITY, VOL 3, TOWARD RESOLVING PROBLEMS IN OUTER CONTINENTAL SHELF TECHNOLOGY.
Resources for the Future, Inc., Washington, D. C.
Vol 3 available for sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402 Price $2.65. April 1974. 87 p.

Descriptors: *Water quality control, *Environmental effects, *Resources development, *Conferences, Exploration, Continental Shelf, Oil industry, Oil pollution, Oil spills, Leases, Drilling, Transportation, Storage.
Identifiers: *Outer Continental Shelf, *Offshore technology, *Environmental impact, Oil production, Containment.

Part Two of the fourth volume in a set of five volumes which make up the report by the Council on Environmental Quality consists of a report by Harry Perry on the Conference Background and Summary. The conference which was requested by the CEQ and held by Resources for the Future Inc., had three goals: evaluate the current status of technology and its applicability for use in the new provinces being considered for leasing; estimate the degree of risk of environmental damage from the application of current technology to the areas; and identify improvements, if any, still required in OCS technology to operate with acceptable environmental risks, and the R&D required to achieve them. The remainder of Part Two consists

of the agenda of the Conference which was held December 5m6, 1973 in Arlington, Virginia; Lists of Participants; and the various panel reports on Drilling Technology, Production Technology, Oil Spills and Containment, and Transport and Storage. (See also W76-11947) (Sinha - OEIS)
W76-11950

OCS OIL AND GAS - AN ENVIRONMENTAL ASSESSMENT. A REPORT TO THE PRESIDENT BY THE COUNCIL ON ENVIRONMENTAL QUALITY, VOL 4, POTENTIAL ONSHORE EFFECTS OF OIL AND GAS PRODUCTION ON THE ATLANTIC AND GULF OF ALASKA OUTER CONTINENTAL SHELF.
Resource Planning Associates, Inc., Washington, D. C.
For sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402 Price $6.65. April 1974. 400 p, numerous fig, tab, ref, append.

Descriptors: *Water quality control, *Environmental effects, *Resources development, *Fossil fuels, *Oil pollution, Alaska, Water pollution, Economics, Land use, Oil industry, Assessments, Social aspects.
Identifiers: *Outer Continental Shelf, U. S. East Coast, U. S. West Coast, *Offshore technology, Environmental impact, Socio-economic impact, Onshore effects, Gulf of Alaska, Petrochemical industry, Hydrocarbons.

This report of the potential onshore effects of offshore oil and gas development on the Atlantic and Gulf of Alaska Outer Continental Shelves makes up the fourth volume in a set of five volumes making up the CEQ's Report to the President. The first two parts present detailed findings for the East Coast and West Coast, respectively. The remainder contains appendixes with backup detail on primary industries, i e., those which were analyzed in depth and on the methodology used to measure onshore socio-economic and environmental impacts. Finally, two computer runs, submitted to the CEQ, supplement the detail provided in Appendixes Vi and IX, and cover the detailed economic and air and water pollution findings. W76-11951

OCS OIL AND GAS - AN ENVIRONMENTAL ASSESSMENT. A REPORT TO THE PRESIDENT BY THE COUNCIL ON ENVIRONMENTAL QUALITY, VOL 5, POTENTIAL BIOLOGICAL EFFECTS OF HYPOTHETICAL OIL DISCHARGES IN THE ATLANTIC COAST AND GULF OF ALASKA.
Massachusetts Inst. of Tech., Cambridge, Mass.
Vol 5 for sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402, Price $6.50. April 1974. 124 p, 11 fig, 47 tab, 163 ref, append.

Descriptors: *Environmental effects, *Oil spills, *Oil pollution, *Resources development, Water quality control, Continental Shelf, Alaska, Water resources, Biota, Water pollution sources, Offshore platforms, Assessments, Birds, Fish, Habitats.
Identifiers: *Outer Continental Shelf, *Environmental impact, Offshore technology, Biological effects, Hydrocarbons, U. S. Atlantic Coast, Gulf of Alaska.

The first report in Volume 5 of the CEQ's Report to the President is an analysis of the primary biological effects of potential oil discharges resulting from hypothetical oil production activity on the Atlantic/Alaskan OCS. Although emphasis is placed on analysis of impacts and recovery from large-volume infrequent accidental oil spills, small volume continuous discharges of hydrocarbons are also considered. Effects of oil releases from offshore platforms and spills occuring at coastal terminals are assessed. This report deals specifically with biological factors and the following conclusions are reached. Biological recovery of habitats in which 100% mortality occurs, after degradation of oil allows recolonization, can only be estimated as 'several years'. In general, fish populations do not appear to be threatened by mortality resulting from oil spills although spawning grounds and larval nursery areas are considered more vulnerable than other regions. Birds appear to be one of the most vulnerable group of populations examined. Spills originating from hypothetical Atlantic offshore platforms are not expected to cause severe biological damage. Little can be said about the biological effects of oil spills occurring in the Gulf of Alaska as not much is known concerning distributions or populations. Large levels of uncertainty exist in all phases of the analysis. Insufficient baseline data exists for all regions which indicates the need for extensive research. (See also W76-11947) (Sinha - OEIS)
W76-11952

OCS OIL AND GAS - AN ENVIRONMENTAL ASSESSMENT. A REPORT TO THE PRESIDENT BY THE COUNCIL ON ENVIRONMENTAL QUALITY, VOL 5, SIMULATION OF HYPOTHETICAL OFFSHORE PETROLEUM DEVELOPMENTS.
Massachusetts Inst. of Tech., Cambridge, Mass.
Vol 5 for sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402, Price $6.50. April 1974. 78 p, 14 fig, 12 tab, 11 ref.

Descriptors: *Resources development, *Environmental effects, *Economics, *Computer programs, *Computer models, Leases, Drilling, Offshore platforms, Pipelines, Continental Shelf, Costs, Economic prediction.
Identifiers: *Outer Continental Shelf, *Offshore technology, Environmental impact, Oil and gas production, Underwater pipelines, Tankers.

The second report in Volume 5 of the CEQ's Report to the President describes estimates of the amount and type of development activity which would be engendered by a series of hypothetical finds on the outer continental shelf. As a function of the geological, locational, and financial/regulatory characteristics of a hypothetical find, interest is in the investors' development strategy, the resulting oil and gas production through time, the number of platforms, amount of drilling activity, and mode (pipeline or tanker) and amount of transport activity. The resulting landed cost of the oil and gas to the nation, the resulting investor profits and the resulting lease, royalty and tax payments are also of interest. To this end, a computer program known as the Offshore Development Model was constructed, tested, and exercised over a large number of possible finds. Some of the results are as follows: For finds at the outer limits of the continental shelf, the program always favors tankers over pipelines for the delivery of oil to shore. For finds 36 miles offshore or less, the program favors pipelines. Variation in price has almost no effect of developer strategy as long as the field can be profitably developed over the range of the variation. The program results are insensitive to variation in reservoir parameter other than oil and gas in place and investor profits and national cost can be sensitive to these variables. The maximum rates at which platforms can be installed can be an extremely important variable in determining the profitability of very large finds. (See also W76-11947) (Sinha - OEIS)
W76-11953

OCS OIL AND GAS - AN ENVIRONMENTAL ASSESSMENT. A REPORT TO THE PRESIDENT BY THE COUNCIL ON ENVIRONMENTAL QUALITY, VOL 5, ANALYSIS OF OIL SPILL STATISTICS.
Massachusetts Inst. of Tech., Cambridge, Mass.
Vol 5 for sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D C 20402, Price $6.50 April 1974. 126 p, 57 fig, 13 tab, 13 ref

Descriptors *Oil spills, *Oil pollution, *Environmental effects, *Estimating, *Evaluation, Forecasting, Data collections, Water quality control, Continental Shelf, Resources development, Exploration, Water pollution sources, Offshore platforms, Pipelines, Probability.
Identifiers: *Outer Continental Shelf, Offshore technology, Environmental impact, Tankers, Offshore production, Mooring, Terminals, U S, Atlantic Coast, Gulf of Alaska.

The third report in Volume 5 of the CEQ's Report to the President describes the analysis to utilize past spill experience to generate estimates of the likelihood of spillage by number and size of individual spill for a range of hypothetical offshore petroleum developments on the Atlantic and Gulf of Alaska continental shelf. Estimates of the numbers and sizes of individual spills are at least as important as estimates of the total volume spilled. The way to attack oil spill statistics is through a two-step process: how many spills will occur, and how much oil will be spilled in an individual spill. Spillage is divided into five categories: tankers and barges, onshore terminals, single buoy moorings, offshore production, offshore pipelines. From the biological point of view, the frequency and magnitude of individual spills is at least as important as total spillage. Therefore estimates are given of the probability densities of the number of spills of a given category which will occur from a given hypothetical development and the probability density of the size of these spills. The estimates of probabilities given can reasonably be regarded as moderately pessimistic. They assume no improvement in technology or operations over the recent past. (See also W76-11947) (Sinha - OEIS)
W76-11954

OCS OIL AND GAS - AN ENVIRONMENTAL ASSESSMENT. A REPORT TO THE PRESIDENT BY THE COUNCIL ON ENVIRONMENTAL QUALITY, VOL 5. OIL SPILL TRAJECTORY STUDIES FOR ATLANTIC COAST AND GULF OF ALASKA.
Massachusetts Inst. of Tech., Cambridge, Mass.
Vol 5 for sale by the Superintendent of Documents, U. S. Government Printing Office, Washington, D. C. 20402, Price $6.50. April 1974. 189 p, 117 fig, 15 tab, 28 ref.

Descriptors: *Oil spills, *Oil pollution, *Water quality control, *Water pollution sources, Resources development, Atlantic Ocean, Alaska, Wind, Waves(Water), Currents(Water), Assessments, Continental Shelf, Forecasting, Weathering, Drift(Aquatic).
Identifiers: *Outer Continental Shelf, *Environmental impact, *Offshore technology, Gulf of Alaska, U. S. Atlantic Coast, Buzzards Bay, Delaware Bay, Charleston Harbor, Terminals.

The fourth report in Volume 5 of the CEQ's Report to the President describes how oil spills can be transported many miles from the site of an accident by the action of wind, waves, and current. The purpose of this study was to obtain insight into the likely behavior of oil spill trajectories emanating from each of the thirteen potential Atlantic outer continental shelf production regions. In addition the likely behavior of oil spills emanating from three potential nearshore terminal areas, Buzzards Bay, Delaware Bay, and Charleston Harbor was examined. Major emphasis in all the analyses was placed on the probability of a spill coming ashore, the time to shore, and, in the case of the terminal analyses, the wind conditions at the time the spill first reaches shore. The analysis dealt solely with the problem of determining where the spill would go due to the combined actions of the wind, waves and currents. There are, however, natural processes that, given sufficient time, te

mitigate the effect of a spill upon beaching on a
ast or entering an estuary. These processes are
ncipally the evaporation of the lighter fractions
o the atmosphere, the dissolution of the soluble
ction into the water, and the breakdown of the
ger oil slicks into ever smaller and more nu-
rous patches by the action of the ambient turbu-
ce. (See also W76-11947) (Sinha - OEIS)

Identifiers: *Earthwatch, *National Environmental Policy Act.

This pamphlet summarizes the activities and programs that various nations have undertaken to protect and control common world environmental needs. The United States, for example, has shouldered its national and international environmental responsibilities by enacting the National Environmental Policy Act of 1969, and by participating in the First United Nations Conference on the Human Environment. Other nations have organized bilateral arrangements, regional organizations, and scientific and other non-governmental bodies to meet international environmental problems. These organizations have realized that new research, better information exchange processes, global monitoring, and training and education programs are needed for effective environmental control. The two largest, most advanced development and assistance agencies are the International Bank for Reconstruction and Development (IBRD), and the Agency for International Development (AID). The activities of these agencies are examined here, as well as recent developments in a project known as 'Earthwatch' which embodies various international environmental control aims. 7. RESOURCES DATA

7A. Network Design

PRELIMINARY EVALUATION OF THE GROUND-WATER DATA NETWORK IN INDIANA,
Geological Survey, Indianapolis, Ind.
J. R. Marie.
Available from the National Technical Information Service, Springfield, Va., 22161, as PB-251 690, $4.50 in paper copy, $3.00 in microfiche. Water-Resources Investigations 76-24, Marroject planning, *Indiana, Project feasibility, Project benefits, Costs, Water wells, Observation wells, Water levels, Water quality.

Descriptors: *Groundwater resources, *Data collections, *Information retrieval, *P
Identifiers: Data dissemination.

The groundwater data program, which was established in Indiana in 1935, has utilized 478 different wells located in every county in the State. More than half the counties have had more than four active wells, and one county has had 32. Water-level data have been collected on a periodic basis from 468 of these wells. The length of record available for individual wells ranges from 1 year to more than 38 years, with an average length of record of more than 9 years. To date, aside from water-level records of various types published for selected wells and the hydrographs kept in the files of the U.S. Geological Survey (copies of the hydrographs are furnished to the cooperator), no data compilations are available. The main purpose of this report is to make a preliminary evaluation of the network and to suggest methods suitable for a future in-depth study. (Woodard-USGS)

EARLY DETECTION AND CORRECTION OF SINKHOLE PROBLEMS IN ALABAMA, WITH A PRELIMINARY EVALUATION OF REMOTE SENSING APPLICATIONS,
Geological Survey, Tuscaloosa, Ala.
J. G. Newton.
Alabama Highway Research, Montgomery HPR Report No 76 (Research Project 930-070), January 1976. 83 p, 49 fig, 3 tab, 38 ref.

Descriptors: *Sinks, *Carbonate rocks, *Land subsidence, *Highways, *Alabama, Datacollec-

tion, Evaluation, Remote sensing, Aerial photography, Design criteria, Roads, Construction, Hydrogeology, Groundwater movement.

Recent sinkhole activity in Alabama has resulted in costly damage to highways and other structures, major pollution, and accidents. Sinkholes are divided into two categories defined as 'induced' and 'natural.' Induced sinkholes are those related to man's activities whereas natural sinkholes are not. Induced sinkholes develop in a much shorter timespan than natural sinkholes. The development of both categories is dependent on some degree of solution of carbonate rocks. Induced sinkholes are divided into types, those resulting from a decline in the water table due to ground-water withdrawals and those resulting from construction. It is estimated that more than 4,000 of these sinkholes, areas of subsidence, or related features have formed in Alabama since 1900. Many sinkholes develop with little or no warning, others are preceded by the formation of recognizable features that can be observed on the ground and from the air. Photographs, and other remote sensing data, are useful in the location and evaluation of potential sinkhole problems along planned highway corridors. (Woodard-USGS)

MEASUREMENT OF LAKE ICE THICKNESS WITH A SHORT-PULSE RADAR SYSTEM,
National Aeronautics and Space Administration, Cleveland, Ohio. Lewis Research Center.
D. W. Cooper, R. A. Mueller, and R. J. Schertler.
NASA Technical Note D-8189, March 1976. 23 p, 16 fig, 5 ref, 1 append.

Descriptors: *Ice cover, *Lake ice, *Remote sensing, Radar, Instrumentation, Lakes, Measurement, Ice, Ice-water interfaces, Surveys, Aircraft, Data processing, Microwaves, Equipment.
Identifiers: *Ice thickness.

Measurements of lake ice thickness were made during March 1975 at the Straits of Mackinac by using a short-pulse radar system aboard an all-terrain vehicle. These measurements were compared with ice thickness determined with an auger. Over 25 sites were explored which had ice thicknesses in the range 29 to 60 cm. The maximum difference between radar and auger measurements was less than 9.8 percent. The magnitude of the error was less than + or - 3.5 cm. The NASA operating short-pulse radar system used in monitoring lake ice thickness from an aircraft was also described. (Sims - ISWS)

Identifiers: *Airborne laser bathymeters.

An airborne laser depth sounding system was built and taken through a complete series of field tests. Two green laser sources were tried: a pulsed neon laser at 540 nm and a frequency-doubled Nd:YAG transmitter at 532 nm. To obtain a depth resolution of better than 20 cm, the pulses had a duration of 5 to 7 nanoseconds and could be fired up to at rates of 50 pulses per second. In the receiver, the signal was detected by a photomultiplier tube connected to a 28 cm diameter Cassegrainian telescope that was aimed vertically downward. At 200 hours of flight time on the NASA C-54 airplane in the area of Chincoteague, Virginia, the Chesapeake Bay, and in Key West, Florida, yielded information on the actual operating conditions of such a system and helped to optimize the design. The maximum depth attainable in a mission can be predicted by measuring the effective attenuation coefficient in flight. This quantity is four times smaller than the usual narrow beam attenuation coefficient. Several square miles of a varied underwater landscape have also been mapped. Such a system can be either used alone in a scanning device or in conjunction with aerial photography to serve as reference. In either case, it promises great savings in time and expense over the usual sounding techniques. (Sims - ISWS)

The objective of the six-month program reported in this summary was to focus the efforts of the NASA grant projects of the Remote Sensing Center on concise demonstrations of the remote sensing techniques and technology developed at Texas A and M University. Several of these projects were documented in this report. These projects included enforcing the quarantine of diseased crops, improving vegetation utilization in urban planning, assisting aquatic plant monitoring and control, continuous area surveillance of oil spills, improving the management of Texas rangelands and increasing the productivity of crops in Texas. This summary also discussed the applications and supporting technology activities of the grant program from which the demonstration projects have evolved. A list of publications under this grant was included. (Sims - ISWS)

SHOWING SELECTED EXTREME-IFLOW STATISTICS AND DRAINAGE GREATER PITTSBURGH REGION, LVANIA,
l Survey, Harrisburg, Pa.
l, Jr., and R. M. Beall.
report 76-350, April 1976. 1 sheet, 2 ref.

Descriptors: *Floods, *Peak discharge, *Flood recurrence interval, *Drainage area, *Maps, Streams, River basins, Gaging stations, Sites, Hydrologic data, Data collections.
Identifiers: *Greater Pittsburgh Region(Pa).

This map serves as a summary guide to extreme-flow statistics and drainage-area data for streams in the Greater Pittsburgh Region, Pa. Peak flood discharges of 100-year (or 50-year) recurrence interval and 7-day, 10-year low-flow discharges are shown for gaging sites for which there are sufficient streamflow records. Drainage-area values are given for all stream-gaging sites and for all named streams draining more than 3 square miles. (Woodard-USGS)
W76-11671

GROUND-WATER LEVELS IN SELECTED BASINS IN THE STATE OF UTAH FROM FEBRUARY-MARCH 1974 TO FEBRUARY-MARCH 1975,
Geological Survey, Salt Lake City, Utah.
Geological Survey map report, 1975. 19 maps.

Descriptors: *Water levels, *Groundwater, *Utah, *Maps, *Water level fluctuations, Basic data collections, Hydrologic data, Aquifers.

Ground-water levels in Utah were generally somewhat lower in February-March 1975 than a year earlier. In much of Pavant Valley and in parts of all major valleys in the northern two-thirds of the state, however, rising water levels were observed. Maps show the amount of water-level change in selected basins from February-March 1974 to February-March 1975 in the following counties: Salt Lake, Juab, Box Elder, Weber, Davis, Beaver, Tooele, Sevier, Millard, Utah, Iron, Cache, Sanpete, and Washington. The maps were prepared as part of a cooperative program of water-resources investigationds in Utah by the Utah Department of Natural Resources, Division of Water Rights, and the U. S. Geological Survey. (Woodard-USGS)

INDEX OF CURRENT WATER RESOURCES PROJECTS AND DATA COLLECTION ACTIVITIES IN OHIO, WATER YEAR 1976,
Geological Survey, Columbus, Ohio.
Geological Survey Project Report, November 1975. 4 p, 2 parts, 2 tab.

Descriptors: *Indexing, *Projects, *Water resources, *Ohio, Surface waters, Groundwater resources, Water quality, Flood plains, Data collections, Methodology, Monitoring, Sampling, Sites, Projections, Planning, Documentation.

This index of water-resources program in Ohio for the 1976 water year (October 1, 1975 - September 30, 1976) consists of two parts: Part A - a listing of current projects and Part B - a listing of hydrologic data-collection stations. Part A contains information concerning the status of all projects in which there will be any activity during water year 1976. Added to these are all new projects proposed for implementation in water year 1976. Part B contains tables showing station numbers and names, types of data collected, and projects benefiting from the data collected at the site. (Woodard-USGS)

LOS ANGELES AND LONG BEACH HARBORS MODEL STUDY; REPORT 1, PROTOTYPE DATA ACQUISITION AND OBSERVATIONS,
Army Engineer Waterways Experiment Station, Vicksburg, Miss. Hydraulics Lab.
E. B. Pickett, D. L. Durham, and W. H. McAnally.
Available from the National Technical Information Service, Springfield, Va. 22161, as ADA012 147 $8.00 in paper copy, $3.00 in microfiche. Technical Report H-75-4, June 1975. 243 p, 9 fig, 9 tab, 14 plate, 16 ref, 12 append.

Descriptors: *Harbors, *Waves(Water), *California, Data collections, Measurement, Instrumentation, Surveys, Equipment, Investigations, On-site investigations, Hydrologic data, Ships, Currents(Water), Tides, Water levels, Hydraulics, *Model studies.
Identifiers: *Los Angeles Harbor(Calif), *Long Beach Harbor(Calif), Wave gages, Recording equipment, Ship motion.

This report describes the instrumentation, operation, calibration, and collected data of a 1-yr prototype wave, tide, and ship movement data acquisition program. From 1 June 1971 to 1 July 1972, wave data were obtained at 1-sec intervals from 13 wave gage stations at selected locations in the Los Angeles and Long Beach Harbors. Barometric pressure was monitored at the central receiving station onshore. In addition to wave data from pressure transducers, tidal height data were obtained from three float-type tide gages. For 15 stations in the harbors, tidal current measurements at three depths in the water column were collected at 1-hr intervals for a 25-hr observation period. In conjunction with wave measurements, data on ship characteristics, mooring configurations, and ship motion were collected and tabulated for vessels berthed in the east channel and west basin of Los Angeles Harbor and in the southeast basin and east basin of Long Beach Harbor. The purpose of the prototype wave observation program was to obtain for a 1-yr period continuous, accurate, and reliable wave data to be used in hydraulic and possibly mathematical models and in evaluating surge conditions in the existing harbors. Ship movement and mooring configuration data was collected to allow correlation of adverse ship motion with prototype wave conditions. Tidal height and currents were measured in the harbors area to provide data for physical hydraulic model verification and to aid identifying potential circulation problems. (Sims - ISWS)

UD METHOD OF RESERVOIR FLOOD ROUTING.
Soil Conservation Service, Washington, D.C. Engineering Div.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-244 622, $6.00 in paper copy, $3.00 in microfiche Technical Release No. 35, February 1967. 115 p, 3 fig, 82 chart.

Descriptors: *Reservoirs, *Flood routing, *Spillways, Charts, Hydraulic design, Design standards, Structures, Hydraulic structures, Engineering structures, Discharge(Water), Fluid mechanics, Hydraulics, Floodways, Overflow, Outlet works.
Identifiers: *UD method.

A rapid but accurate method of routing the emergency spillway and freeboard storms through reservoirs is important to determine the least costly proportions for floodwater-retarding or multiple-purpose structures. Many reservoir flood routing methods are available. However, each method has certain limitations. To overcome these limitations, the UD Method makes it possible to obtain in a few minutes a direct solution to the basic flood routing equation, inflow is equal to outflow plus the change in storage. It provides a means of investigating combinations of emergency spillway widths and maximum water surface elevations for any given emergency spillway crest elevation. It also makes it possible for the engineer to examine the effect of: (1) the principal spillway system, (2) the emergency spillway layout and design, (3) the velocity at the control section of the emergency spillway, and (4) the velocity in the exit channel of the emergency spillway. The answers obtained by the UD Method have been checked by the graphical flood routing procedure for a large number of sites. The results of the cases tested agreed almost exactly with the answers obtained from the graphical method. This release presents the theory, nomenclature, procedures, design charts, and examples of the method. Work sheets are included to facilitate the flood routing computations. (Sims-ISWS)

DRAG REDUCING POLYMER IN HELICOIDAL FLOW,
Johns Hopkins Univ., Baltimore, Md. Dept. of Mechanics and Materials Science.
J. T. Kuo, and L. S. G. Kovasznay.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-A013 088, $4.00 in paper copy, $3.00 in microfiche. Technical Report No. 75-1, July 1975. 35 p, 14 fig, 7 ref, append. ONR N00014-67-A-0163-0002.

Descriptors: *Flow, *Drag, *Polymers, Laboratory tests, Mathematical models, Fluid mechanics, Hydraulics, Hydrodynamics, Model studies, Turbulence, Flow friction, Flow resistance, Chemicals, Organic compounds.
Identifiers: *Drag reduction, Dilute polymer solution, Helicoidal flow, Screw pumps.

A novel flow configuration was explored for the study of the behavior of drag reducing polymers. A screw pump consisting of a smooth cylinder and a concentrically placed screw was used to create a strongly three-dimensional but essentially laminar flow. In the first phase of the study, the static pressure head developed by the screw pump was measured as a function of polymer concentration (polyox 10 to 100 ppm). A large increase of the developed head was observed that behaved in an analogous manner to drag reduction as far as concentration, aging, and straining was concerned. In the second phase of the study a new apparatus was constructed and an additional parameter of a superimposed through flow was included and the degree of failure of the superposition principle was established. Sensitivity of the phenomenon to the pH value of the solution was also studied and the parameter again behaved similarly to the dr

ion. As a theoretical support of the effort, a mathematical model was explored based on o dimensional equivalent of the experiment uration. (Sims-ISWS)

Since the device is not af- he tide, the damping effect is not varied. prevents the mixing and change of sea the accumulation of sand or erosion of by wave. (Sinha - OEIS)

E-COMPLETION GEOTHERMAL PRODUCTION SYSTEMS,
Huisen.
No. 3,957,108, 6 p, 6 fig, 1 tab, 9 ref; zette of the United States Patent Of- 6, No 3, p 1061, May 18, 1976.

: *Patents, *Geothermal studies, Temperature, Heat exchangers, Ther- Energy, Wells, Drilling.

for the mining of geothermal energy a geothermal wells radiate from a single into a subsurface geothermal reser- lls can be drilled by conventional slant niques and each may contain a closed xchanger which receives water and eam. Some of the heat exchangers are ally and others are implanted horizon- ernating production of the wells in a programmed cyclical manner, convective movement of the hydrothermal fluid will occur within the geothermal zone. The generated steam is collected in a reservoir at the surface site and utilized to generate electricity. The condensate from the turbine can be recycled to the wells. Depending on the condition of the geothermal zone, the system may require further structure. In a wet geothermal zone, the fluid will operate as a carrier for the heat energy to deliver it to the surface under pressure. In the case of a dry geothermal zone or one containing insufficient pressure, the implantation of closed end heat exchangers at the ends of the wells requires means for conducting heat exchange fluid which may be connected to the turbine to return the condensate to the heat exchanger in a closed cycle loop. (Sinha - OEIS)

GRAVITY WAVES PROPAGATED OVER PERMEABLE BOTTOM,
Polish Academy of Sciences, Gdansk. Inst. of Hydraulic Research.
S. R. Massel.
Journal of the Waterways, Harbors and Coastal Engineering Division, American Society of Civil Engineers, Vol. 102, No. WW2, Proceedings Paper 12107, p 111-121, May 1976. 3 fig, 10 ref, 4 append.

Descriptors: *Gravity waves, *Waves(Water), *Coastal engineering, Porous media, Sands, Hydraulics, Wavelength, Foundations, Equations, Mathematical studies.
Identifiers: *Wave energy, *Wave-bottom interaction, Wave propagation, Damping, Forchheimer equation.

Based on Forchheimer equation and potential theory, the propagation of small amplitude surface waves over a permeable bed was examined. The special linearization technique that is based on the assumption of the equivalent work (Lorentz' hypothesis) was employed in order to determine analytically the velocity field and pressure field. Demanding the continuity of pressure and velocity components at the interface, the damping factor and wave number for arbitrary permeability were found. The example calculations showed that the influence of the permeability on the pressure distribution is negligibly small. (Lee - ISWS)
W76-11853

PARAMETERS AFFECTING STABILITY OF RUBBLE MOUNDS,
Norges Tekniske Hoegskole, Trondheim. Institutt for Anleggsdrift og Havnebygging.
P. Bruun, and P. Johannesson.
Journal of the Waterways, Harbors and Coastal Engineering Division, American Society of Civil Engineers, Vol. 102, No. WW2, Proceedings Paper 12136, p 141-164, May 1976. 28 fig, 5 tab, 29 ref.

Descriptors: *Breakwaters, *Harbors, *Jetties, *Sea walls, Equations, Permeability, Porosity, Friction, Waves(Water), Laboratory tests, Mathematical models.
Identifiers: *Rubble mounds, Rubble masonry, Blocks, Armors, Downrush, Uprush.

The hydraulic reasons for failure of rubble structures suggesting improvements in design methods are examined. The importance of forces by uprush and downrush, and forces depending upon friction and permeability was analyzed. The most dangerous combinations of these forces and of resonance between uprush/downrush period and wave period were evaluated. The conclusion was that armor units should be 'placed'. Impermeable sheets should be put in the upper as well as in the lower part of the slope. Furthermore the commonly used trapezoidal linear slope profile should be substituted by better reasoned design to obtain a greater degree of compatability between the wave action, slope geometry structure, and armor unit geometry. A 'self-adjusted' profile may be divided into three zones with different slope angle and block-characteristics and combined to achieve maximum stability. (Lee - ISWS)
W76-11854

ROUGHNESS EFFECTS ON RECTANGULAR FREE OVERFALL,
Alberta Univ., Edmonton. Dept. of Civil Engineering.
N. Rajaratnam, D. Muralidhar, and S. Beltaos.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 102, No. HY5, Proceedings Paper 12152, p 599-614, May 1976. 8 fig, 2 tab, 20 ref, 2 append.

Descriptors: *Flow measurment, *Roughness(Hydraulic), Open channel flow, Depth, Turbulent flow, Hydraulics, Equations, Hydraulic models, Model studies.
Identifiers: *Critical depth, Free overfall, Rough rectangular free overfall.

For a rectangular free overfall, the end depth ratio (EDR) has been well connected with the main parameters using dimensional analysis. Using experimental results on three different roughnesses, it has been found that the EDR can be predicted from the curve Delleur, et al., for smooth channels, if the relative roughness is less than about 0.1. If the relative roughness is greater than 0.1, then the EDR is reduced by the roughness and this effect has been correlated using the experimental results. A method has been proposed to predict the discharge from the measured end depth for a rough rectangular free overfall. (Lee-ISWS)
W76-11855

SAFETY FACTORS FOR RIPRAP PROTECTION,
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
M. A. Stevens, D. B. Simons, and G. L. Lewis.
Journal of the Hydraulics Division, American Society of Civil Engineers, Vol. 102, No. HY5, Proceedings Paper 12115, p 637-655, May 1976. 7 fig, 22 ref, 1 append.

Descriptors: *Stream stabilization, *Riprap, *Stability, *Tractive forces, *Safety factors, *Slope stabilization, Flow, Velocity, Gradation, Design standards, Movement, Drag, Equations.
Identifiers: Lift force, Flow angularity.

The merit of a particular riprap design can be represented by numerical value of the riprap safety factor, defined as the ratio of moments resisting particle motion to the moments tending to rotate the particle out of the riprap blanket. A safety factor of unity denotes incipient motion. From theoretical considerations, a relation was established between the riprap safety factor and the magnitude and direction of the flow velocity in the vicinity of the riprap, the angle of the side slope, and the angle of repose for the riprap. The design procedures of the Corps of Engineers, the Bureau of Reclamation, the California Division of Highways, the Bureau of Public Roads and others were evaluated in terms of the riprap safety factor. Some of the designs have safety factors less than unity indicating that there could be a loss of riprap material when the design flows are obtained. (Lardner - ISWS)

DRILLERS STARTED AT THE BOTTOM AND WENT DOWN.
The Johnson Drillers Journal, Vol. 48, No. 3, p 7, May-June, 1976. 1 fig.

Descriptors: *Water wells, Drilling equipment, *Arizona, Drilling, Water yield, Drawdown.
Identifiers: *Grand Canyon(Ariz).

A water well was drilled at the bottom of the Grand Canyon in northwest Arizona by the Bureau of Indian Affairs, Southern Pueblos Agency, Rangewater Section. The well was drilled using a Bucyrus Erie 1W drilling rig which was disassembled and transported to the canyon floor by helicopter. Well screens were delivered to the well site by pack-horse following sample evaluation. The well was drilled in a fine riverbottom material to a depth of 90 feet with a 6 inch casing to 82 feet, 4 inch casing riser from 67 to 82 feet, and a 4 inch screen from 82 to 90 feet. The yield is 40 gallons per minute at 10 feet of drawdown. (Heiss-NWWA)

POTENTIAL PUMPED STORAGE PROJECTS IN THE PACIFIC SOUTHWEST.
Federal Power Commission, Washington, D.C. Bureau of Power.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-242 798, $4.00 in paper copy, $3.00 in microfiche. Report, 1975. 37 p, 8 fig, 4 tab, 9 maps.

Descriptors: *Powerplants, *Pumped storage, *Sites, *California, *Arizona, *Nevada, *Utah, *Southwest US, Electric power, Electric powerplants, Hydroelectric power, Federal Power Act, Peak power, Dams, Reservoirs, Tunnels, Reservoir storage, Projects, Project planning, Reservoir sites.
Identifiers: *Potential sites.

About 400 possible pumped storage sites were identified from United States Geological Survey quadrangle maps covering the states of California, Arizona, Utah, and Nevada. About 245 sites, or over 60%, were eliminated because they did not meet the site selection criteria adopted for the study. These criteria were related to the following: (1) operating pattern, (2) plant size and characteristics, (3) topography, (4) reservoir size and characteristics, (5) conduit size and characteristics, (6) source of pumping energy and load center, and (7) areas excluded. The remaining 155 sites would have an ultimate installed capacity of 341,100 megawatts. Generating capacity of the plants ranged from a minimum of 1,000 megawatts (at all sites) to a maximum of 7,800 megawatts (at one site). (Sims-ISWS)
W76-11764

WAVE ENERGIZED PUMP,
H. Lloyd.
U.S. Patent No. 3,957,398, 3 p, 6 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 946, No 3, p 1156, May 18, 1976.

Descriptors: *Patents, *Water utilization, *Pumps, *Pumping plants, *Waves(Water), Pontoons, Fluctuations, Energy, Control systems, Water level.
Identifiers: Wave control.

A floating pumping apparatus of considerable length (600 ft) is provided which defines its own wave channel between two elongated pontoons. Pumps distributed along the channel are operated by a float which moves up and down in response to wave action within the channel. The pumps are all connected together in such a manner that a somewhat uniform output is obtained even though the wave action is not indentical at different parts of the channel. The pontoons are each cavitated or compartmented with a carefully controlled amount of ballast water in each compartment to lend stability to the entire assembly. The compartments as well as the pumps are fed from a common sump in which the level of the water is the same as that of the surrounding sea or lake. An adjustable baffle at at least one end of the channel controls the entry of waves into the channel in such a manner that the amplitude of the admitted waves, while not uniform, will be more or less controlled within limits of operability of the pumping apparatus. Double acting pumps are employed and the throw of the pump pistons can be adjusted as to the direction in which the pistons operate. (Sinha-OEIS)

DEEP SEA TANK AND SEAPORT SYSTEM,
S. J. Memoli.
U.S. Patent No. 3,958,521, 5 p, 8 fig, 2 ref; Official Gazette of the United States Patent Office, Vol 946, No 4, p 1543, May 25, 1976.

Descriptors: *Patents, *Offshore platforms, *Oil pollution, *Oil spills, Water pollution control, Resources development, Oil industry, Drilling, Barriers, Pipelines, Continental Shelf.
Identifiers: *Outer Continental Shelf, *Offshore technology, Seaports, Containment, Tankers.

A deep sea tank and seaport system is disclosed. The system includes deep sea tanks which provide a containment barrier surrounding one or more towers which function as a docking facility for oil tankers. The deep sea tanks are connected to a cable surrounding the tower, with an opening at either end of the tank arrangement to permit access by the oil tankers to the tower. The tower employs features which ensure a stabilized platform, while allowing easy access to the tankers. The tower is equipped with living and operational spaces for the crew, and a pipeline is provided to allow transfer of oil to the shore. The present system is advantageously employed around oil drilling rigs and in other environments in which it is desired to contain oil spills or other pollutants floating on the water. A skirt member interposed between adjacent tanks define the boundary of a containment area. Certain of the tanks can be anchored to the seabed. (Sinha-OEIS)

ACCESS SHAFTS POSED PROBLEMS,
The Johnson Drillers Journal, Vol 48, No. 3, p 8-9, May-June, 1976. 3 fig, 2 tab.

Descriptors: *Rotary drilling, *Boreholes, *Shafts(Excavations), Drilling equipment, Casings, Drilling fluids, Aquifers, Groundwater, Glacial drift, Storm drains, Minnesota
Identifiers: *Open-hole drilling, Large diameter core barrels, Pilot holes, St. Paul(Minnesota)

The Tri-State Drilling and Equipment Company of Hamel, Minnesota, constructed four vertical shafts for a storm sewer drainage system. The shafts ranged from 12 to 18 feet in diameter and 102 to 110 feet in depth. The excavations were constructed, using open-hole drilling methods and specially fabricated, large diameter core barrels. This unusual construction method was employed due to the presence of the water table at a depth of only 8 to 15 feet below the surface. The shafts penetrated 102 feet of glacial drift, into 20 feet of the Platteville limestone. For each shaft a 12 foot length of surface casing was set of a diameter a little larger than the finished borehole diameter. A 7 foot diameter pilot hole was then drilled into bedrock. This was then successively enlarged in stages by using several sizes of core barrels, each one from 12 to 24 inches larger than the preceeding tool. The borehole was kept full of bentonite drilling mud at all times to prevent caving and effectively seal any shallow aquifers encountered. Two Watson 5000 crane-attached drilling assemblies, stacked one above the other, provided the rotary motion and power for the core barrels. Tri-State equipment was on the job for about 3 months. (Heiss-NWWA)
W76-11913

VARIABLE SPEED PUMPING HAS MANY ADVANTAGES,
Moodys of Dayton, Inc., Miamisburg, Ohio.
C. R. Buck.
The Johnson Drillers Journal, Vol. 48, No. 3, p 13-14, May-June, 1976. 3 fig.

Descriptors: *Centrifugal pumps, *Pump turbines, *Water pumping, Water conveyance, Water wells
Identifiers: *Variable speed pumps, Constant speed pumps, Pump applications.

A pump is selected to meet a combination of pressure-discharge values as required for the specific water system. If the system demand changes substantially with respect to either total pressure or flow rate, a constant speed pump may not satisfy the systems water demand. Variable speed pumps, however, provide performance which satisfies changing system requirements, as well as the ability to adjust the control pressures and flow rates. Some of the advantages of variable speed operation over start-stop cycling are: extended equipment life, reduced voltage dips, reduced hydraulic surges, higher efficiency, reduced power consumption and less maintenance. The variable speed pump responds to changes in speed by the mechanisms: (1) flow rate varies directly with speed in rpm, (2) head varies with the square of the rpm change, (rpm1-rpm2)2, and3 3) power required varies with the cube of the rpm change, (rpm1-rpm2),. Most of the variable speed pump applications are designed to maintain constant pressure on both municipal and industrial water systems. (Heiss-NWWA)

FIELD PROVEN TECHNIQUES IMPROVE CEMENTING SUCCESS,
Exxon Co. Houston, Tex.
J. A. Holley.
World Oil, Vol. 183, No. 2, p 31-33, August, 1976. 1 fig, 2 tab, 2 ref.

Descriptors: *Grouting, *Cement, Drilling fluids, Oil wells, Slurries.
Identifiers: *Tubingless completions, *Conventional completions, *Reciprocation technique, Simultaneous rotation, Scatchers, Centralizers, Mixing techniques.

A successful cementing technique developed originally for 2 7/8 - inch tubingless completions, has been expanded to conventionally completed wells. The cementing methods that were utilized were divided into five primary categories: (1) cementing slurries; (2) mixing and displacement technique; (3) pipe movement; (4) mechanical aids attached to the pipe; (5) mud properties prior to cementing. The data indicated that the cementing procedures used were successful. In addition it was established that the technique of simultaneously rotating and reciprocating pipe while cementing is profitable for conventional completions, but is unnecessary for 2 7/8 - inch tubingless completions in 7 7/8 - inch holes. METHOD OF INHIBITING SCALE FOR HIGH TEMPERATURE STEAM WELLS,
Union Oil Co. of California, Brea. (Assignee).
H. E. Zilch, and P. W. Fischer.
U.S. Patent No. 3,958,635, 5 p, 9 ref; Official Gazette of the United States Patent Office, Vol 946, No 4, p 1581, May 25, 1976.

Descriptors: *Patents, *Geothermal studies, *Scaling, *Temperature, *Inhibition, Inhibitors, Chemical reactions, Ions, Alkaline earth metals, Wells.

The scale-forming ions most commonly found in geothermal fluids are the alkaline earth metal cations, such as calcium, magnesium, and barium and various anions such as carbonate, bicarbonate, sulfate, phosphate, oxalate and silicate. When combinations of these anions and cations are present in concentrations which exceed the solubility of their reaction product, precipitation of solids which build up to form scale will occur. To retard scale formation, a scale inhibitor must be mixed with the aqueous fluid before scale formation occurs. Thus, in some instances, it may be necessary to inject the inhibitor into the formation via the production well or via an offset well. A method of inhibiting the formation of scale from geothermal fluids having a temperature of 400 deg F. and above is to add a water-soluble substituted iminodi(methylene phosphonic acid) compound having a carbon-to-phosphorus bond or a water-soluble salt. The inhibitor can be added in concentrated form to the aqueous media containing the scale-forming ions or it can be utilized in the form of an aqueous solution. (Sinha-OEIS)

AT THE END OF YOUR ROPE...,
Paulsen Wire Rope Corp., Pittsburgh, Pa.
W. H. Myers.
Drilling-DCW, Vol. 37, No. 11, p 43-44, 74-76, August, 1976. 6 fig, 1 tab.

Descriptors: *Drilling equipment, Safety factors, Metals.
Identifiers: *Wire rope attachments, *Wire rope, Sockets, Splices, Swaged fittings, Clips, Clevises, Shackles.

Wire rope end attachments may be as important as the wire rope to which they are fastened. Users of wire rope must have a good working knowledge of the types of end attachments and understand how they affect rope serviceability. Efficiencies of the most widely used wire rope end attachments vary from 100 percent of rope nominal strength with Spelter sockets to 75 - 90 percent with Wedge sockets. Hand-tucked splices, Mechanical splices, Swaged steel fittings and Wire rope clips all fall between these limits. (Each fitting type has its individual advantages for specific jobs.) Specific designs of the terminal or combinations of fittings are infinite in their possibilities. Standard catalog items would include open and closed sockets, both poured and swaged, hooks, eyes, clevises, shackles, threaded studs, straight buttons, and turnbuckles. Each fitting type has its individual advantage for specific applications. The selection of an end attachment should involve careful considerations of its application requirements. (Heiss-NWWA)

ENCRUSTATION,
Plummer and McDannald Co., Galena, Ohio.
R. B. McDannald.
Water Well Journal, Vol. 30, No. 8, p 7, August, 1976.

Descriptors: *Corrosion, *Water wells, *Well screens, *Iron bacteria, Calcium carbonate, Manganese, Aerobic bacteria, Chlorination, Solubility, Groundwater, Shale, Gravel, Dissolved solids, Oxidation, Chemical precipitation, Aquifers.
Identifiers: *Encrustation, *Mineral encrustation, Manganic oxide, Taps, Pressure tanks, Pump columns, Connectors, Bacteria plugging, Pumping rates, Check valves, Pressure switches.

Encrustation, commonly confused with corrosion, is normally caused by a lowering of pressure in well water. Lowering of the pressure below normal static conditions tends to upset the equilibrium of the ground water's solubility, which in turn results in formation and precipitation of insoluble minerals. Iron bacteria, being aerobic are generally found in shallow wells. Bacterial plugging, is commonly caused by iron bacteria organisms which develop thread-like slime growths. These growths oxidize dissolved iron and manganese and accumulate large pods of rust in slime. To sustain growth, iron bacteria must have 1 ppm or more of iron or manganese. Iron problems can be controlled by the use of chlorine, although there is no permanent solution. To prevent spread into other wells, drilling tools should be rinsed off with chlorine solution. Also, each well should be chlorinated at the completion of any work. Insoluble minerals precipitate regardless of material and incrustation can build up on the gravel of the aquifer. Some steps to eliminate encrustation problems are: (1) provide open area in well screen to reduce velocity of water, (2) reduce drawdown to improve well efficiency by matching the pumping rate, (3) Use periodic chemical treatment, (4) keep oxygen away from affected area. (Grober-NWWA)
W76-11912

HOW TO DRILL A USABLE HOLE PART I - WHY DEVIATION OCCURS,
Drilco, Houston, Tex.
G. E. Wilson.
World Oil, Vol. 183, No. 2, p 40-43, August, 1976. 8 fig, 10 ref.

Descriptors: *Rotary drilling, *Wells, Oil wells, Drilling equipment.
Identifiers: *Drill collars, *Borehole deviation, Doglegs, Key seats, Drill pipe fatigue, Stuck pipe, Casing wear.

Crooked holes cause problems such as doglegs and key seats that can result in increased drilling costs, destroy drilling equipment and cause problems in production operations. The purpose of using drill collars is to increase the weight on the bit without applying compressive force to the drill pipe. Such forces when applied to a rapidly rotating string of pipe will result in premature pipe failure. While drill collars can help reduce crooked holes it does not entirely eliminate the problem. A number of theories were developed to explain borehole deviation. Robert S. Hock suggested that drilling with an unstabilized bit will result in hole deviation if hard ledges are encountered. H. E. Treichler theorized that the lateral movement of an unstabilized bit in non-dipping formations tends to cut a spiraled hole. The whiptoils theory was introduced by H. M. Rollins. It suggested that when formations dipping less than 45 are drilled, the bit may tend to drill updip which causes a deviated hole, resulting from the formation of whipstocks that develop between rock laminations. Regardless of the cause, hole deviation can result in drill pipe fatigue, stuck pipe, stuck logging tools, problems with setting casing, and production problems. (Gass-NWWA)
W76-11915

USING FRACTURE TRACES TO LOCATE WATER WELLS,
National Water Well Association, Worthington, Ohio.
T. E. Gass.
Water Well Journal, Vol. 30, No. 8, p 30-31, August, 1976.

Descriptors: *Fractures, *Permeability, *Joints geology, *Aerial photography, Alluvium, Water wells, Aquifers, Groundwater, Igneous rock, Metamorphic rock, Sedimentary rock, New York.
Identifiers: *Fracture zones, *Fracture traces, Consolidated rock, Siltstone, Adirondack Mountains(NY).

The techniques of using fracture traces in locating wells are by no means new. To understand fracture traces, you must first understand the concept of permeability. Permeability refers to the ease with which water flows through rock material. The permeability of a rock unit determines whether or not it will yield an adequate amount of water to a well. Among the factors affecting the permeability of a consolidated rock is the degree to which the rock is fractured. Fractures generally increase the permeability of an aquifer. Many metamorphic and igneous rocks and some sedimentary rocks such as siltstone and shale, will yield very low quantities of water unless fractures are encountered in the rock during drilling. Fractures increase the permeability of a rock by establishing passages or channels which provide less resistance to the flow of water than the surrounding rock. After understanding fractures, the next step relates to finding these fractures or fracture zones. The appearance of a fracture or fracture zone on the earth's surface is called a fracture trace. Using aerial photographs, fracture traces easily show up as dark, straight line segments; lines of darker soil caused by increased soil moisture; straight, narrow rows of vegetation; and as cracks on bedrock surfaces. Most evidence supports the conclusion that fracture traces, and underlying fracture zones, can be an important tool for ground water exploration. (Grober-NWWA)
W76-11916

PREVENTING LIGHTNING DAMAGE TO PUMPS.
Ground Water Age, Vol. 10, No. 11, p 27-29, July, 1976. 5 fig.

Descriptors: *Lightning arrestors, *Lightning, *Electrical grounding, Electrical equipment, Pumps, Water wells.
Identifiers: *Lightning damage, *Water well pump protection, Overhead powerlines, Voltage surges.

The destructive action of most lightning discharges can be prevented by the use of properly installed arrestors, grounding and lightning rods. Lightning rods and other grounding mechanisms are made of copper or other metals with good conduction properties certain configurations and arrangements of grounding mechanisms can insure protection of the areas they cover. Protection of water well pump motors from lightning discharge and power surges induced by lightning may be implemented by the use of lightning arrestors. In general, the application of lightning arrestors consist of: (1) selection of the voltage rating, (2) choosing the specific type of arrestor required, and (3) determination of arrestor placement to insure adequate yet economical protection. (Heiss-NWWA)

IMPRESSION TOOL EVALUATES PERFORATION EFFECTIVENESS,
Standard Oil Co. of California, Western Operations, Inc., Oildale.
G. W. Anderson.
World Oil, Vol. 182, No. 6, p 57-62, May, 1976. 8 fig, 4 tab, 6 ref.

Descriptors: *Drilling equipment, *Well casings, Boreholes, Wells, Permeability, Test procedures, California.
Identifiers: *Inflatable packers, *Downhole perforations, *Perforation impression tool, *Jet perforations, Well stimulation, Permeability correlations.

A new inflatable packer system has been developed by Standard Oil Company of California, for producing accurate impressions of downhole perforations, milled slots and other features on the inside surface of casings or liners. Special materials allow long lasting impressions to be made quickly with low differential pressures. The recovered tool gives an immediate visual picture of the wellbore condition. Quantitative evaluations can be made by measuring the packer surface extrusions and applying special calibrations to obtain true dimensions of downhole features. In the case of jet perforations it can be determined if individual perforations are connected to the permeable formation. Field data taken with the inflatable impression packer indicates that, without further stimulation, less than 50 percent of new jet perforations are effective in low-pressure, unconsolidated California oil sands. (Heiss-NWWA)
W76-11918

HELICOPTER RIG CAN DRILL TO 20,000 FEET.
World Oil, Vol. 182, No. 6, p 89-90, May, 1976. 2 fig.

Descriptors: *Drilling equipment, *Oil wells.
Identifiers: *Helicopter transportable drilling rig, *Module concept, Improved drilling economy.

The Ideco Model MSH-2000, a new helicopter transportable rig rated for drilling to 20,000 feet, is the largest of its kind ever constructed. Designed for rapid assembly and disassembly using 4,000-pound modules; the rig was built for Pertamina, the Indonesian state oil company and will be delivered to Balikpapan, Borneo, Indonesia. Two important objectives included in the design to improve over-all drilling economy are: (1) minimized man hours required for assembly/disassembly and readying the equipment for airlift (2) reducing the total number of lifts by using highly engineered module concepts throughout the design. The drawworks are rated for 2,000 horse power nominal and has four speeds forward and two reverse speeds to the drum. Two forward and two reverse speeds through engine mounted transmission - converter units, and two forward speeds from a Hi-Lo friction clutch transmission, also are provided. Cat works and rotary drive are independent units. Driller controls installed on the floor control all drilling and hoisting functions. Rig power is provided by six engines. The sand line unit is complete with a Caterpillar engine and twin disc converters. The block is a shorty unitized traveling model with a tripler hook rated at 360 tons with five 42-inch sheaves. The swivel with a 300-ton rating is complete with washpipe packing, lower sub and gooseneck hose assembly. The mast is rated at 710,000 pounds hookload capacity using 10 lines. Substructure capacity is 650,000 pounds on the rotary table and 340,000 pounds in the pipe set-back area. (Heiss-NWWA)

HOW TO BUILD A FLOATING SCRAP TIRE BREAKWATER,
Rhode Island Univ., Narragansett. Dept. of Ocean Engineering and Marine Advisory Service.
T. Kowalski, and N. Ross.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-251 142, $3.50 in paper copy, $3.00 in microfiche. Rhode Island University Marine Bulletin No. 21, 1975. 15 p, 8 fig, 5 ref. 04-3-158-3.

Descriptors: *Continental Shelf, *Breakwaters, *Construction, *Coasts, *Coastal engineering, *Shore protection, *Offshore platforms, Costs, Protection, Waste disposal.
Identifiers: *Outer Continental Shelf, *Floating scrap tires, *Coastal protection, Scrap tires.

Scrap tires can be used by marinas to construct breakwaters at the cost per linear foot ranging from $4 to $30. Tests performed on a prototype showed that it could reduce by 75% the wave heights of 3- to 4-foot waves, and by up to 100% the height of 1/2-foot waves. Besides low costs, these breakwaters present other advantages. They can be used where surface-to-bottom breakwaters are not feasible, they are movable, and they utilize a resource which is readily available at very low cost. (Sinha-OEIS)

tate Water Survey, Urbana.
mphreys, and W. D. Lembke.
o. 76-2090 presented at Annual meeting n Society of Agricultural Engineers, Univ., Lincoln, June 27-30, 1976. 8 p, 3 T W-203(No. 6250)(1). 14-34-0001-6250.

rs: *Information retrieval, *Information , *Agricultural engineering, *Water , Water pollution sources, Nitrates, ater, Water quality, Publications, Data s, Abstracts, Documentation.

rs, practicing engineers, and administraricultural engineering have an interest in ect of the water resources field. They rmation to assist them in meeting the ds of agriculture and to solve water reblems. A national water resources data een established by the Water Resources Information Center (WRSIC), Office of search and Technology, U.S. Departterior. At present the data base contains 93,000 abstracts of published literature on water resources, and the base is growing at a rate of about 13,000 per year. WRSIC publishes abstracts in 'Selected Water Resources Abstracts.' Each semi-monthly issue contains approximately 550 abstracts. In addition, the abstracts are stored in a computer data bank for machine retrieval. Assembling input information for the data base and retrieving information were discussed. Results of a computer search showed a large amount of information related to the nitrate groundwater problem is available to the agricultural engineer. Judicious use of computer searches should substantially reduce the time normally required in a library for retrieving specific literature applicable to an agricultural engineer's water related problem. KARST TOPOGRAPHY
Most Jamaican Water Comes from Limestone Aquifers,
W76-11910 4B

KELP
Incidence of Polychlorinated Biphenyls in Clyde Seaweed,
W76-11810 5C

KENTUCKY
Reservoir Effects on Property Values According to Location and Rural VS. Urban Use,
W76-11708 4A

KIEL CANAL
The Legal Setting of International Canals,
W76-12027 6E

KINETICS
Interaction of Blue-Green Algae with Multiply-Charged Inorganic Cations, (In Russian),
W76-11736 5A

KNYSNA ESTUARY (SOUTH AFRICA)
Trace Metals in Oysters from Knysna Estuary,
W76-11966 2L

KOREA
The Concentrations of Mercury, Cadmium, Lead and Copper in Fish and Shellfish of Korea, (In Korean),
W76-11729 5A

LABORATORY METHODS
Some Effects of Pollutants on the Behaviour of the Bivalve Tellina Tenuis,
W76-11960 5C

LAGOON OF VENICE (ITALY)
Elimination of Hydrocarbons by Mussels,
W76-11822 5C

LAKE ALICE (FLORIDA)
Ecosystem Modeling of Waterhyacinth Management in Lake Alice, Florida,
W76-11884 5G

LAKE BASINS
Agricultural Practices to Reduce Non-Point Pollution in the Okeechobee-Kissimmee Basin,
W76-12041 6E

LAKE FERTOE (HUNGARY)
Methods for Computing the Evaporation of Lake Fertoe, (In German),
W76-11741 2D

LAKE ICE
Measurement of Lake Ice Thickness with a Short-Pulse Radar System,
W76-11753 7B

LAKE KINNERET (ISRAEL)
Carbon-13 Enriched Carbonate in Interstitial Waters of Lake Kinneret Sediments,
W76-12140 5C

LAKE OKEECHOBEE (FLA)
Water Management During Drought Events,
W76-12000 4A

LAKE ONTARIO
International Field Year for the Great Lakes.
W76-11847 2H

LAKE SCHIEREN (W GERMANY)
The Importance of Zooplankton in the Metabolism of Lake Schieren, (In German),
W76-11735 5C

LAKE SEDIMENTS
A Fickian Analysis of Lake Sediment Upsurge,
W76-11692 2J

The Lake Texcoco (Mexico) Sediments and their Capacity to Support Vegetation, (In French),
W76-11738 2J

The Role of Benthic Metabolism in a Bog Lake,
W76-11906 5C

Benthic Metabolism of a Soft-Water Lake,
W76-11907 5C

Carbon-13 Enriched Carbonate in Interstitial Waters of Lake Kinneret Sediments,
W76-12140 5C

LAKE SHCHELKUN (USSR)
Characteristics and Production Potentials of Zooplankton from Lake Shchelkun in the Middle Urals, (In Russian),
W76-11737 5C

LAKE SUPERIOR
The Battle of Lake Superior: Reserve Mining's Big Sewer,
W76-12020 5G

LAKE SVETLOYAR (USSR)
Ecology of Planktonic Infusoria of Secondary-Oligotrophic Lake, (In Russian),
W76-11728 5C

LAKE TEXCOCO (MEXICO)
The Lake Texcoco (Mexico) Sediments and their Capacity to Support Vegetation, (In French),
W76-11738 2J

LAKES
Surface Water Supply of the United States, 1966-70: Part II. Pacific Slope Basins in California--Volume I. Basins from Tijuana River to Santa Maria River,
W76-11669 7C

The Lake Texcoco (Mexico) Sediments and their Capacity to Support Vegetation, (In French),
W76-11738 2J

Practical Applications of Space Systems, Supporting Paper 5, Inland Water Resources.
W76-11758 4A

Environmental Impact Assessment, Water Quality Analysis, Utah Lake - Jordan River Basin.
W76-11788 5G

Ecosystem Modeling of Waterhyacinth Management in Lake Alice, Florida,
W76-11884 5G

The Role of Benthic Metabolism in a Bog Lake,
W76-11906 5C

Benthic Metabolism of a Soft-Water Lake,
W76-11907 5C

Central Illinois Public Service Co. V. EPA (The Taking Issue and Effluent Standards).
W76-12112 6E

Thermal Stratification and Heating Mechanisms in a Small Lake,
W76-12139 2H

LAND APPLICATION
EPA Guidance and Policy on Land Treatment,
W76-11638 5D

Public Health Aspects of Land Application of Wastewater Effluents,
W76-11639 5D

Experience with Land Application of Wastewater and State Regulations - The Pennypack Watershed,
W76-11642 5D

W76-11842 8G

UNIVERSIDAD DE LOS ANDES, MERIDA (VENEZUELA). DEPT. OF SYSTEMS ENGINEERING.
Distributed Parameter Identification of Groundwater Systems by Nonlinear Estimation,
W76-11957 2F

UNIVERSITY COLL. OF NORTH WALES, BANGOR. MARINE SCIENCE LABS.
Seasonal Variation of Dissolved Metals in Inshore Waters of the Menai Straits,
W76-11722 5B

UNIVERSITY COLL. OF WALES, ABERYSTWYTH. DEPT. OF GEOLOGY.
Trace Metal Concentrations in Fucus from the Bristol Channel,
W76-11719 5C

UNIVERSITY OF MANCHESTER INST. OF SCIENCE AND TECHNOLOGY (ENGLAND). POLLUTION RESEARCH UNIT.
Caesium-137: Its Accumulation in a Littoral Community,
W76-11808 5C

UNIVERSITY OF SOUTH FLORIDA, TAMPA. DEPT. OF BIOLOGY.
Distribution and Abundance of the Polychaetous Annelids in a South Florida Estuary,
W76-11987 5C

UNIVERSITY OF SOUTHERN CALIFORNIA, LOS ANGELES. ALLAN HANCOCK FOUNDATION.
Marine Studies of San Pedro Bay, California. Part III. Thermal Tolerance and Sediment Toxicity Studies,
W76-11793 5C

Thermal Effects and San Pedro Bay,
W76-11794 5C

Preliminary Observations on the Lower Minimum Temperature Requirements of the Northern Anchovy,
W76-11795 5C

Effects of Sub-Normal Temperatures on Some Common Los Angeles Harbor Animals,
W76-11796 5C

Tolerance of Littorina Planaxis and Littorina Scutulata to Temperature Changes,
W76-11798 5C

Preliminary Investigations of the Effects of Resuspended Sediment on Two Species of Benthic Polychaetes from Los Angeles, Harbor,
W76-11799 5C

URAL AND SIBERIAN FISHERY SCIENTIFIC-RESEARCH AND PLANNING INST., SVERDLOVSK (USSR).
Characteristics and Production Potentials of Zooplankton from Lake Shchelkun in the Middle Urals, (In Russian),
W76-11737 5C

USSR ACADEMY OF SCIENCE, MOSCOW, INSTITUTE OF STATE AND LAW.
The Legal Setting of International Canals,
W76-12027 6E

The Outer Boundary of the Continental Shelf,
W76-12030 6E

USSR ACADEMY OF SCIENCES, MOSCOW, INSTITUTE OF STATE AND LAW.
Problems in the Use of International Straits,
W76-12026 6E

The Status of Historic Waters (Doctrine and Practice),
W76-12028 6E

Legal Problems of the Territorial Sea Regime,
W76-12029 6E

UTAH STATE UNIVERSITY, LOGAN. DEPT OF BIOLOGY.
Nitrogen Cycling in Microcosms and Application to the Biology of the Northern Arm of the Great Salt Lake,
W76-11778 5C

VANDERBILT UNIV., NASHVILLE, TENN. DEPT. OF ENVIRONMENTAL AND WATER RESOURCES ENGINEERING.
Environmental Impact Assessment, Water Quality Analysis, J. Percy Priest Reservoir.
W76-11787 5G

VERMONT UNIV., BURLINGTON. DEPT. OF ENTOMOLOGY.
Chronic Oil Contamination and Aquatic Organisms with Emphasis on Diptera: Status and Bibliography,
W76-11709 5C

VIRGINIA POLYTECHNIC INST. AND STATE UNIV., BLACKSBURG. CENTER FOR ENVIRONMENTAL STUDIES.
Bacterial Populations of Aquatic Systems Receiving Different Types of Stress,
W76-11704 5C

VSESOYUZNYI NAUCHNO-ISSLEDOVATELSKII INSTITUT GIGIENI I TOKSIKOLOGII PESTITSIDOV, KIEV (USSR).
Determination of M-Phenylenediamine in Water, (In Russian),
W76-11730 5A

WASHINGTON STATE DEPT. OF ECOLOGY, OLYMPIA. OFFICE OF TECHNICAL SERVICES.
Interim Report, Cooperative Grays Harbor Surveillance Program-1970,
W76-11894 5D

WASHINGTON UNIV., SEATTLE. DEPT. OF ELECTRICAL ENGINEERING.
Engineering Uses of EROS,
W76-11765 7B

WATER RESOURCES ENGINEERS, INC., AUSTIN, TEX.
Water Quality Analysis, Upper Rio Grande.
W76-11785 5G

WATER TECHNOLOGY SERVICE, INC., CLEVELAND, OHIO. (ASSIGNEE).
Water Treatment Device with Transitorized Circuit,
W76-11833 5F

WATERLOOPKUNDIG LABORATORIUM, DELFT (NETHERLANDS).
Offshore Sediment Transport and Equilibrium Beach Profiles,
W76-11937 2L

WATERMANTION, INC., SAINT PAUL, MINN.
Remote Control of Combined Sewer Overflows,
W76-11630 5D

WEIZMANN INST. OF SCIENCE, REHOVOTH (ISRAEL). DEPT. OF ISOTOPE RESEARCH.
Carbon-13 Enriched Carbonate in Interstitial Waters of Lake Kinneret Sediments,
W76-12140 5C

WEST VIRGINIA UNIV., MORGANTOWN. WATER RESEARCH INST.
Removal of Undesirable Cations from Acid Mine Water by a New Cation-Exchange Material,
W76-11776 5D

WESTERN ONTARIO UNIVERSITY, LONDON, CANADA, DEPARTMENT OF GEOGRAPHY.
UNIVERSITY OF WESTERN ONTARIO, LONDON. DEPT. OF GEOGRAPHY.
International Management of the Great Lakes-St. Lawrence Basin,
W76-11887 2H

WISCONSIN UNIV., MADISON. SCHOOL OF LAW.
The Settlement of International Environmental Disputes,
W76-11983 6E

WOLLONGONG UNIV. COLL. (AUSTRALIA). DIV. OF BIOLOGY AND CHEMICAL SCIENCES.
An Evaluation of the Miller Method for Dissolved Oxygen Analysis,
W76-12144 5A

WOODS HOLE OCEANOGRAPHIC INSTITUTION, MASS.
Preliminary Results with a Pilot Plant Waste Recycling Marine-Aquaculture System,
W76-11932 5D

LIBRARY U. OF I. URBANA-CHAMPAIGN

SELECTED WATER RESOURCES ABSTRACTS

The Library of the
SEP 1977
University of Illinois
at Urbana-Champaign

VOLUME 9, NUMBER 23
DECEMBER 1, 1976

W76-12151 -- W76-12675
CODEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS is produced by the Office of Water Research and Technology, U.S. Department of the Interior, and published twice monthly by the National Technical Information Service (NTIS), U.S. Department of Commerce, for the Water Resources Scientific Information Center (WRSIC).

SELECTED WATER RESOURCES ABSTRACTS (SWRA) is available to Federal agencies and their contractors or grantees in water resources research upon request, citing contract or grant number and sponsoring agency. Write: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, DC 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from NTIS, 5285 Port Royal Road, Springfield, VA 22161. Annual subscription rates for the North American Continent are: SWRA Journal only, $75; Journal and Annual Indexes, $100; Indexes only, $50. Other addressees, write for prices.

Some documents abstracted in this journal can be purchased from NTIS at prices shown in the entry; prices subject to change. Other documents are available from originating organizations or authors as indicated in the citation.

LIBRARY U. OF I. URBANA-CHAMPAIGN

SELECTED WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior

VOLUME 9, NUMBER 23
DECEMBER 1, 1976

W76-12151 -- W76-12675

Secretary of the U.S. Department of the Interior has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

LIBRARY U. OF I. URBANA-CHAMPAIGN

FOREWORD

elected Water Resources Abstracts, a semimonthly journal, includes abstracts of current and earlier pertinent nographs, journal articles, reports, and other publication nats. The contents of these documents cover the water-ted aspects of the life, physical, and social sciences as l as related engineering and legal aspects of the charac-stics, conservation, control, use, or management of water. h abstract includes a full bibliographical citation and a set escriptors or identifiers which are listed in the **Water ources Thesaurus.** Each abstract entry is classified into ields and 60 groups similar to the water resources re-rch categories established by the Committee on Water ources Research of the Federal Council for Science and hnology.

SIC IS NOT PRESENTLY IN A POSITION TO PROVIDE PIES OF DOCUMENTS ABSTRACTED IN THIS JOUR-. Sufficient bibliographic information is given to enable lers to order the desired documents from local libraries ther sources.

cted Water Resources Abstracts is designed to serve scientific and technical information needs of scientists, neers, and managers as one of several planned services e Water Resources Scientific Information Center SIC). The Center was established by the Secretary of the ior and has been designated by the Federal Council for nce and Technology to serve the water resources com-ity by improving the communication of water-related arch results. The Center is pursuing this objective by co-ating and supplementing the existing scientific and tech-information activities associated with active research investigation program in water resources.

rovide WRSIC with input, selected organizations with e water resources research programs are supported as ters of competence" responsible for selecting, abstract-ing, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on the inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the Bio-Science Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

CONTENTS

FOREWORD iii

SUBJECT FIELDS AND GROUPS

Please use the edge index on the back cover to locate Subject Fields and Indexes

01 NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

02 WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

03 WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

04 WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Nonwater Activities; Watershed Protection

05 WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution. Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

06 WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

07 RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

08 ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

09 MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education—In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

10 SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

ONAL SIMULATION OF STREAMFLOW A,
Carolina State Univ., Raleigh. Dept. of gical and Agricultural Engineering.
Wiser.

Available from the National Technical Information Service, Springfield, VA 22161 as PB-257 496, $7.75 in paper copy, $3.00 in microfiche. North Carolina Water Resources Research Institute, Raleigh, UNC-WRRI Rpt. No. 116, July 1976. 196 p, 19 fig, 4 tab, 11 ref, 7 append. OWRT B-064-NC(2). 14-31-0001-4112.

Descriptors: *Streamflow forecasting, *Streamflow, *Watersheds(Basins), Digital computers, Rainfall, Reservoir sites, Lakes, Evapotranspiration, Rainfall-runoff relationships, *North Carolina, Model studies, Computer models, Simulation analysis, Regional analysis.
Identifiers: *Flow estimates, *Streamflow Synthesis and Reservoir Regulation(SSARR), *Hydrologic Information Storage and Retrieval System(HISARS), Sub-basins, Neuse River(NC), Yadkin River(NC).

A system has been developed for simulation of streamflow data at any point in a region. The system is known as NCSSARR (North Carolina version of the Streamflow Synthesis and Reservoir Regulation model). NCSSARR is based on the Streamflow Synthesis and Reservoir Regulation (SSARR) model developed at the North Pacific Division of the Corps of Engineers in Portland, Oregon. Control programming minimizes input requirements to permit a planner with limited hydrologic or computer background to use the system. The system is interfaced with the data storage and retrieval system known as HISARS to provide convenient data access as well as routine processing of the simulated streamflow. NCSSARR permits a broad range of capabilities, ranging from fairly simple simulation requiring minimal input to very sophisticated simulation utilizing the full capabilities of SSARR but requiring extensive input. Streamflow can be simulated for small relatively homogeneous watersheds or for large streams combining flow from a number of different areas. This report provides a general description of the system. Other chapters deal with hydrologic and computer procedures to implement the system, and describe a series of tests, comparing simulated flows with observed records. Documentation of the programs is provided in Appendices. (Stewart-North Carolina State)

ON HYDROBIOLOGY: CRITICAL MISAPPREHENSIONS CONCERNING THE DISCIPLINE, (IN HUNGARIAN),
Lajos Kossuth. Univ., Debrecen (Hungary). Zoological Inst.
G. Devai.
Acta Biol Debrecina. 10/11, p 101-116, 1972.

Descriptors: *Hydrobiology, Hydrologic aspects, Biology, Oceanography, Hydrology.
Identifiers: Biotope, *Cryobiology, Disciplines, *Limnobiology, *Potamobiology, *Stigobiology.

According to the International Association for Scientific Hydrology, this science consists of the branches: potamology, limnology, cryology and stigology. A definition of the science of hydrobiology and a statement of purpose are given. This science consists of 5 fields of study; oceanobiology, limnobiology, potamobiology, stigobiology and cryobiology. Basically, all are concerned with 'water quality', which is defined as the degree of complementary interaction between the animate and inanimate components of a biotope. A correct evaluation of the interrelationships of these components is integral to an accurate prediction of the future state of a body of water.--Copyright 1975, Biological Abstracts, Inc.

PLOT-DERIVED PARAMETERS FOR BASIN COMPUTATIONS,
Agricultural Research Service, Beltsville, Md. Hydrograph Lab.
G. H. Comer, and H. N. Holtan.
Hydrological Sciences Bulletin, Vol. 21, No. 1, p 53-59, March 1976. 3 fig, 2 tab, 7 ref.

Descriptors: *Basins, *Model studies, *Digital computers, *Runoff, Watersheds(Basins), Hydrologic systems, Soil analysis, Crops, Hydrology, Data collections.
Identifiers: Plot-derived parameters, *Basin computations, Plots, Digital basin model, Cropping patterns, Hydrological records, Watershed hydrology, Climatological data.

Data from small plots within a basin were used with a digital basin model to estimate parameters for computing runoff from the entire basin. The Hydrograph Laboratory of the United States Department of Agriculture developed and tested a mathematical model which treated a basin as a distributed system to operate on homogeneous hydrological response units of the basin. The parameters inferred from soils and crop data were optimized using the digital model to compute runoff from the plots. The optimized values of soil and crop parameters were then used to compute the runoff from the total basin. The data requirements for the model included the climatological data, basin descriptors, and soil parameters. Climatological data included precipitation, air temperature, and evaporation rate. Basin data required land use data, soil data, and crop data. The results demonstrated the value of plot data and the importance of a deterministic model which used parameters derived from readily available soil and crop data. (Roberts-ISWS)

WATER YIELD MODEL USING SCS CURVE NUMBERS,
Agricultural Research Service, Temple, Tex.
J. R. Williams, and W. V. LaSeur.
Journal of the Hydraulics Division, Vol 102, No HY9, p 1241-1253, September 1976. 6 tab, 6 ref.

Descriptors: *Agricultural watersheds, *Reservoir design, *Runoff, *Soil moisture, *Water yield, Soil conservation, Mathematical models, Equations, Simulation analysis, Optimization, Computers, Rainfall, Systems analysis.

A model was developed to predict daily runoff from agricultural watersheds with areas up to 2,590 km2. The model is based on the SCS runoff curve number procedure and a soil moisture index. It was designed to have general applicability, computational efficiency, simple inputs, and good prediction accuracy. The model has one parameter, uses a 1-day time interval, and only outputs runoff volume. Inputs are an estimate of the II-condition SCS runoff curve number, measured monthly runoff, daily rainfall, and average monthly lake evaporation. The model is calibrated on a gaged

watershed and can be used to extend short periods of record for the calibrated watershed or to predict water yield for nearby ungaged watersheds. In tests with data from 47 watersheds in Texas, the model simulated runoff fairly accurately. Applications include reservoir design, water quality modeling, and flood control evaluation. STUDY OF THE LOWER STRATOSPHERIC THERMAL STRUCTURE AND TOTAL OZONE FROM NIMBUS-4 IRIS,
National Aeronautics and Space Administration, Greenbelt, Md. Goddard Space Flight Center.
C. Prabhakara, and E. B. Rodgers.
NASA Technical Note D-8134, January 1976. 35 p, 25 fig, 19 ref, 1 append.

Descriptors: *Ozone, *Temperature, *Remote sensing, Satellites(Artificial), Infrared radiation, *Atmosphere, Maps, Mapping, Monthly, Measurement, Circulation, Meteorology, Equations.
Identifiers: *Nimbus-4, *Stratosphere, Lower stratosphere, Global distribution.

The global distribution of temperature in the stratosphere from 100 to 10 mbar and the total ozone in the atmosphere were remotely sensed from the Nimbus-4 IRIS measurements for a period of about one year. The temperature and ozone data were presented in the form of monthly mean global maps. The standard deviations of temperature and ozone with respect to zonal averages were calculated. The mean and the variable state of the stratosphere were discussed with the help of these observations. The lower stratosphere in the tropical regions revealed a significant wave number one pattern in the circulation. The Arctic and Antarctic stratospheric winter circulation regimes displayed a different behavior apparently due to the ocean and orographic differences. (Sims-ISWS)

ATMOSPHERIC STRUCTURE AND VARIABILITY IN AREAS OF CONVECTIVE STORMS DETERMINED FROM 3-H RAWINSONDE DATA,
Texas A and M Univ., College Station. Center for Applied Geosciences.
G. S. Wilson, and J. R. Scoggins.
Contractor Report NASA CR-2678, April 1976. 118 p, 65 fig, 1 tab, 32 ref, 1 append. NASA NAS8-26751.

Descriptors: *Storms, *Cloud physics, *Convection, Thunderstorms, Weather, Equations, Variability, Distribution patterns, Rainfall, Rainfall disposition, Forecasting, Measurement, Stability, Moisture, Radar, Data processing, Meteorology, *Atmosphere, Atmospheric physics.
Identifiers: *Rawinsonde data.

The structure and variability of the atmosphere in areas of radar-observed convection are established by using the unique 3-h rawinsonde and surface data from NASA's second Atmospheric Variability Experiment (AVE II) conducted on May 11 and 12, 1974. Convective activity was shown to exist in areas where the low and middle troposphere is moist and the air is potentially and convectively unstable and has upward motion, in combination with positive moisture advection, at either the surface or within the boundary layer. The large variability of the parameters associated with convective storms over time intervals less than 12 h was also demonstrated so as to possibly produce a change in the probability of convective activity by a factor of 8 or more in 3 h. Between 30 and 60% of the total changes in parameters associated with convective activity over a 12-h period was shown to take place during a 3-h period. These large changes in parameters, normally measured with 12-h data, were related to subsynoptic-scale systems that many times produced convective storms. (Sims - ISWS)

RAINFALL GENERATION: A NONSTATIONARY TIME-VARYING MULTIDIMENSIONAL MODEL,
Puerto Rico Univ., Mayaguez. Dept. of Civil Engineering.
R. L. Bras, and I. Rodriguez-Iturbe.
Water Resources Research, Vol. 12, No. 3, p 450-456, June 1976. 3 fig, 2 tab, 24 ref. NWS Contract 4-36738.

Descriptors: *Rainfall, *Model studies, *Storms, Algorithms, Statistics, Water resources, Precipitation(Atmospheric), Rainfall intensity, Areal, Hyetographs, Equations.
Identifiers: *Rainfall generation, *Rainfall synthesis, Multidimensional model, Rainfall models, Exterior rainfall characteristics, Interior rainfall characteristics, Nonstationary multidimensional rainfall generator, Point rainfall.

Most existing rainfall models do not concentrate on storm exterior characteristics. Very few models attempt to generate exterior and interior rainfall characteristics everywhere in space, and those that do have limiting assumptions of stationary behavior at all levels of storm activity. Therefore, a nonstationary, multidimensional model was suggested. The suggested model, capable of simulating historical storm exteriors and interiors, assumed the validity of G. I. Taylor's hypothesis turbulence within the storm interior. First-order statistics of storm interiors as well as the correlation in time and space of the storm interiors were preserved. The model had the advantages of being based on concepts easy to understand, being multi-dimensional, and being computationally easy to implement. The research described would be applicable for any kind of rational description of the rainfall process. (Roberts - ISWS)
W76-12208

FINE-SCALE TIME VARIATIONS OF RAINFALL IN WESTERN OREGON,
Oregon State Univ., Corvallis. School of Oceanography.
C. L. Trump, and W. P. Elliott.
Water Resources Research, Vol. 12, No. 3, p 556-560, June 1976. 3 fig, 3 tab, 11 ref.

Descriptors: *Rainfall, *Oregon, *Illinois, *Pacific Ocean, Winter, Linear programming, Statistics, Storms, Mathematical studies, Precipitation(Atmospheric), Time series analysis, On-site investigations, Variability, Seasonal, On-site data collections.
Identifiers: *Rain rates, Western Oregon rainfall, Fine-scale time variations, Winter rainy season, Nondimensional variability statistics, Illinois rainfall, Summer convective rainfall, Linear function.

One-minute rain rates were measured at three sta tions on a line running inland from the coast acros a low mountain range during a winter rainy season The average of three nondimensional variabilit statistics were significantly greater on the coas than inland. Rain rate distributions showed that greater portion of the rain fell at higher rates o the coast, and autocorrelation analysis showe that the rainfall was less persistent on the coas than inland. Oregon results were compared wit similar results concerning Illinois summer convec tive rainfall. Even though the Illinois rainfall wa distinctly more intense and less persistent than th Oregon rainfall, the relative variabilities were su prisingly similar. The logarithm of the total rai falling at rates greater than a given rate was foun to be a linear function of that rate. It was foun that the concentrations of large airborne sea-sa particles, the cloud-forming nuclei, peaked at th coastline and dropped off rapidly inland. (Robert - ISWS)

A HIGH SIERRA PRECIPITATION MEASURE MENT PROGRAM, FINAL REPORT ON TH 1975 SEASON,
Atmospherics Inc., Fresno, Calif.
T. J. Henderson, M. Henderson, and M. Morris.
Report, November 15, 1975. 34 p, 2 fig, 3 tab, 5 ap pend.

Descriptors: *Precipitation(Atmospheric *Rainfall, *Mountains, *California, Measuremen Rain gages, Rainfall disposition, Elevation, Ru noff, Water temperature, On-site investigation Meteorology, Climatology.
Identifiers: *Sierra Mountains, Rain gage networ

Historically, reliable rainfall totals at high altitud in remote mountain areas are usually the weak lin within the broad field of hydrologic studies. Th has been particularly true throughout many of th high altitude regions of the Southern Sierra Rang in California where precipitation measuremen during the summer months have been limited to few scattered locations. New investigations streamflow runoff relationships, plus an increa ing emphasis on more efficient water use, hav focused attention on the importance of summe precipitation at elevations above 9,000 ft msl. late 1971, Atmospherics Incorporated and th Kings River Conservation District, Fresn California, began a series of discussions on th feasibility of establishing a temporary high altitud raingage network in the Southern Sierra Range California. This report described the various a tivities associated with the 1975 High Sier Precipitation Measurement Program and sum marized the results obtained during the variou network visitations in the 1972, 1973 and 197 seasons. CENTRAL SIERRA PROFILING SNOW GAGE: A GUIDE TO FABRICATION AND OPERATION,
Forest Service (USDA), Berkeley, Calif. Pacific Southwest Forest and Range Experiment Station.
L. Smith, H. G. Halverson, and R. A. Jones.
Atomic Energy Commission, Oak Ridge, Tenn., Technical Information Center, TID-25986, February 1972. 53 p, 10 fig, 3 tab, 6 ref, 4 append.

Descriptors: *Snowpacks, Snowmelt, Radioisotopes, Snow management, Fabrication, Flood forecasting, Runoff forecasting, Precipitation gages, Instrumentation, *California.
Identifiers: Snowpack density, Snowpack depth.

Studies at the Central Sierra Snow Laboratory in California have produced a remotely operated snow gage with which snowpacks may be profiled. Snowpack density and depth are printed in gm cm- and hundredths of feet from ground line to snow- interface. Water content can be computed from the data. Detailed instructions are given for manufacture, calibration, operation, and data reduction. (Forest Service)
W76-12158

DEVELOPMENT OF A RADIOACTIVE ISOTOPE PROFILING SNOW GAGE,
Forest Service (USDA), Berkeley, Calif. Pacific Southwest Forest and Range Experiment Station.
L. Smith, H. G. Halverson, and R. A. Jones.
Atomic Energy Commission, Oak Ridge, Tenn., Technical Information Center, February 1972, 72. 86 p, 28 fig, 50 ref, 2 append.

Descriptors: Radioisotopes, *California, Streamflow forecasting, Snow management, Snowmelt, Calibration, *Instrumentation, *Snowpacks, Precipitation gages.
Identifiers: Snowpack density, Snowpack depth.

Since 1909, when the technique of snow surveying to determine water content of the snowpack was developed, many gravimetric methods have been designed and used. At the U. S. Forest Service's Central Sierra Snow Laboratory in California, seven generations of profiling snow gages using radioactive isotopes have been developed and used. The final product is a twin-probe gage with which a snowpack of any depth can be profiled. With density in gm cm-3 for each one-half inch and depth of each location in hundredths of feet are printed on a paper tape. Calibration equations have been solved. The gage can be used for streamflow forecasting from snowmelt and for studies in snow hydrology. (Forest Service)
W76-12159

SEASONAL SNOW SURFACE ENERGY BALANCE IN A FOREST OPENING,
Forest Service (USDA), Berkeley, Calif. Pacific Southwest Forest and Range Experiment Station.
G. Halverson.
Atomic Energy Commission, Oak Ridge, Tenn., Technical Information Center, TID 26242, August 2. 73 p, 11 fig, 3 tab, 62 ref, append.

Descriptors: Snow management, *Snowmelt, Snowpacks, Radioisotopes, Land management, Energy budget, *Seasonal, *Precipitation gages, Measurement, *California.
Identifiers: Snowpack density.

Calculation of seasonal energy balance is a promising method of predicting the snowpack water balance. In-situ snow density measurements are obtained in an open area 400 feet in diameter of the profiling snow gage. The water balance is estimated with snow gage data. Measurements of humidity gradients, windspeed, temperature, and net radiation were also obtained at 30-minute intervals for use in calculating the components of the energy balance for the snowpack surface. During the 1967-68 season, the water balance estimate indicated that 31.59 inches of water fell as snow and melted or evaporated between January 1 and April 26. The corresponding energy balance estimates of snow ablation totaled 32.18 inches for the same period. From December 10, 1968 to May 23, 1969, 60.85 inches water equivalent ablated according to the water balance; the energy balance predicted 60.74 inches. Evaporation as calculated by the energy balance averaged only 0.42 inches per month. Sensible heat transfer was negligible during the accumulation season. It became positive during the melt period. Net radiation averaged less than 50 cal cm-2 day-1 during the accumulation season, but during the melt period it averaged over 100 cal cm-2 day-1. Latent heat flux was usually small (less than 30 cal-2cm-1day-1) and gradually declined to zero during the late spring snowmelt season. Melt and refreezing were important forms of daily energy storage and release. (Forest Service)

MEASUREMENT OF SNOWPACK WETNESS,
Forest Service (USDA), Berkeley, Calif. Pacific Southwest Forest and Range Experiment Station.
W. I. Linlor, J. L. Smith, M. F. Meier, F. C. Clapp, and D. Angelakos.
In: Proceedings 43rd Annual Meeting Western Snow Conference, Coronado, California, Measurement of Snowpack Wetness, April 1975. p 14-20. 6 fig, 2 tab. Paper 590-75.

Descriptors: Snow management, *Snowpacks, Streamflow forecasting, *Precipitation gages, Moisture content, Measurement, Methodology, Snowmelt, Instrumentation, Capacitors, Microwaves.
Identifiers: Dielectric loss, *Electrical methods(Measurement), *Snow wetness.

Three electrical methods for measuring wetness of snow are: (1) Change in capacitance of a sample before and after freezing. (2) Dielectric loss (or quality factor) of a sample in a high-frequency field. (3) Attenuation of a microwave beam in transmission through snow. Of the three electrical methods, two require sampling, but the microwave system can be operated entirely automatically in remote installations, utilizing satellite telemetry for data gathering. (Forest Service)

SNOW WETNESS MEASUREMENTS FOR MELT FORECASTING,
National Aeronautics and Space Administration, Moffett Field, Calif. Ames Research Center.
W. I. Linlor, F. D. Clapp, and M. F. Meier.
In: Procedings Workshop on Operational Applications of Satellite Snowcover Observations, South Lake Tahoe, Calif., August 1975, National Aeronautics and Space Administration, p 375-397, 1975. 6 fig, 3 tab, 32 ref.

Descriptors: *Runoff forecasting, *Snowmelt, *Snowpacks, Snow management, Telemetry, *Precipitation gages, *Moisture content, Water supply, Flood forecasting, Water equivalent, *Microwaves, Measurement, Instrumentation.
Identifiers: *Snow wetness.

A microwave technique for directly measuring snow pack wetness in remote installations is described. The technique, which uses satellite telemetry for data gathering, is based on the attenuation of a microwave beam in transmission through snow. (Forest Service)
W76-12165

REMOTE SENSING OR SNOWPACK DENSITY USING SHORTWAVE RADIATION,
National Environmental Satellite Service, Washington, D.C.
M. C. McMillan, and J. L. Smith.
In: Proceedings Workshop on Operational Applications of Satellite Snowcover Observations, South Lake Tahoe, California, August 1975, National Aeronautics and Space Administration, p 361-374, 1975. 6 tab, 26 ref.

Descriptors: *Snowpacks, *Snowmelt, Snow management, *Albedo, Measurement, Runoff forecasting, Flood prediction, *Precipitation gages, *Radiation, *Remote sensing.
Identifiers: *Snowpack density.

Albedo or satellite radiance measurements can be used to estimate average snowpack density by means of a multiple linear equation. The in situ data equation predicted density with a correlation (r2) of 0.79 and a standard error of 0.027 gm cm-3. The data from LANDSAT-1 were not as significant in a similar equation, possibly because of the large field of view. (Forest Service)
W76-12167

O18/O16 ABUNDANCE VARIATIONS IN SIERRA NEVADA SEASONAL SNOWPACKS AND THEIR USE IN HYDROLOGICAL RESEARCH,
Calgary Univ. (Alberta). Dept. of Physics.
H. R. Krouse, and J. L. Smith.
In. Proceedings International Hydrolic Decade Snow and Ice, Banff, Canda, September 1972, p 24-38, 1973. 6 fig, 11 ref.

Descriptors: *Snowpacks, Snow management, Snowmelt, *Tracers, *California, Water supply, Ice, *Radioisotopes, *Oxygen isotopes, Isotope studies.
Identifiers: *Sierra Nevada(Calif).

In addition to other parameters, O18/O16 abundances were determined for new fallen snow and snowpacks at 1900 m elevation in the central Sierra Nevadas of California during storms in the winters of 1965-68. The O18 values ranged from -5 to -26 0/00 SMOW (Standard Mean Ocean Water). Isotopic minima that have been identified with the coldest winter precipitations in other studies were not discernible. Isotopic compositions were not determined solely by temperature but depended upon other factors such as wind direction. The isotopic composition of individual layers changed markedly as melt water moved through the pack. These changes were related to hydrologic processes such as ice granule formation and water absorption by individual snow layers. No relation was found between snow density and isotope composition. It is concluded that when ice layers are formed under topographic and atmospheric conditions typical of this area, the identification of seasonal trends in glaciers is extremely difficult and subject to misinterpretation. Available from the National Technical Information Service, Springfield, VA 22161 as AD-A010 329, $5.50 in paper copy, $3.00 in microfiche. Special Report 43, Pt. VII, April 1975. 103 p, 7 fig, 6 tab, 8 ref.

Descriptors: *Ice, *Arctic, *Subarctic, *Alaska, *Canada, Cold regions, Ice cover, Lake ice, Rivers, Sea ice, Winter, Measurement, Surveys, Data collections.
Identifiers: *Ice thickness.

This seventh in a series of reports on lake and river ice and land-fast sea ice presented ice thickness measurements observed throughout the North American Arctic and subarctic during the 1970-71 and 1971-72 winter seasons. Information on surface ice conditions, dates of first ice, freeze-over and breakup, and detailed measurements of ice thickness across Alaskan rivers were also included. Some reports from the Alaska National Guard network on ice thickness measurements in remote areas of western Alaska were also presented. Analyses were made of maximum observed ice thicknesses reported during the two winters, and deviations from the mean ice thickness measured across rivers and creeks in southeast Alaska between 1965 and 1972. A tabulation of the dates when maximum ice was observed at 25 locations in Alaska, 44 in Canada, and 1 in Greenland during each year from 1961 to 1972 was also given. Computations of the average annual date of maximum ice at all the stations and an isoline map showing the results for northern North America was presented. (Sims - ISWS)

FIELD DETERMINATION OF THE DENSITIES OF LAKE ICE SHEETS,
Trent Univ., Peterborough (Ontario). Dept. of Geography.
W. P. Adams.
Limnology and Oceanography, Vol. 21, No. 4, p 602-608, July 1976. 3 fig, 2 tab, 12 ref.

Descriptors: *Ice, *Lake ice, *Density, *Canada, *Lakes, Surveys, On-site investigations, Snow cover, Ice cover, Buoyancy, Measurement, Equations, Winter.
Identifiers: *Ice density, *Gillies Lake(Ontario), *Knob Lake(Ontario).

A method of calculating the mean density for a lake ice sheet and estimating the mean density of the white ice component of such a sheet made use of the buoyancy equation for floating ice. The equation related the density of the ice to the mean density and thickness of water and snow, and the thickness of the ice. The technique required the measurement of snow density on the lake. Mean ice sheet densities of 0.89 and 0.85 g/cu cm and mean white ice densities of 0.84-0.87 were reported from two lakes. (Sims - ISWS)

A SNOWMELT RUNOFF MODEL AND ITS APPLICATION TO SHORT-RANGE FORECASTING OF FLOOD DISCHARGES,
Hydrometeorological Service of the USSR, Moscow.
A. P. Zhidikov, A. G. Levin, N. S. Nechaeva, and E. G. Popov.
Hydrological Sciences Bulletin, Vol. 21, No. 1, p 195-202, March 1976. 2 fig, 8 ref.

Descriptors: *Snowmelt, *Runoff, *Model studies, *Forecasting, Mathematical models, Floods, Equations, Rivers, Flow, Precipitation(Atmospheric), Snowfall, Snow cover, Watersheds(Basins), Discharge(Water), Hydrographs, Spring, Seasonal, Reservoirs, Water resources.
Identifiers: *USSR, *Volga River(USSR), Short-range forecasting, Spring flood.

A snowmelt runoff model was derived for relatively small rivers. The model involved the main components of the catchment water budget: physiographical and some other factors: water equivalent of snow cover, precipitation, antecedent moisture content, daily snowmelt, non uniformity of snow cover, retention capacity of the basin, and percentage of forest area. The model structure included calculations of the daily values of snowmelt excess and the transformation of these values into discharges at the outlet of the basin based on meteorological observations and appropriate distribution functions. Both calculations were made separately for open and forest areas. The parameters of the model were derived by optimization methods. The linear model based on the superposition principle was used to transform the discharges of a small river into total inflow into a large reservoir. The combined model was used to forecast for five days in advance daily mean inflows into the Gorky and Kuibyshev reservoirs (on the River Volga), using the observed and forecast discharges of the small rivers as input. (Sims-ISWS)

PAVEMENT CRACKING IN WEST TEXAS DUE TO FREEZE-THAW CYCLING,
Texas A and M Univ., College Station. Dept. of Civil Engineering.
S. H. Carpenter, R. L. Lytton, and J. A. Epps.
In: Frost, Moisture, and Erosion; Transportation Research Record 532, Transportation Research Board, National Research Council, Washington, D. C., p 1-13, 1975. 12 fig, 1 tab, 22 ref.

Descriptors: *Highways, *Freezing, *Thawing, *Texas, Roads, Road construction, Paving, Highway icing, Salts, Laboratory tests, Finite element analysis, Temperature, Moisture content, Civil engineering, Freeze-thaw tests.
Identifiers: West Texas, *Pavement cracking, Freeze-thaw cycling, Pavements, Soil suction, Biaxial freezing.

Freeze-thaw contraction of the base course material used in west Texas is considered an important element in pavement deterioration. Sam

les from two compactive efforts were frozen in a iaxial closed system. Suction and temperature ithin the samples were monitored and volume ianges after each freeze-thaw period were corded. Coefficients of thermal activity were lculated from the dimension measurements. hese coefficients showed a relationship with the -compacted total soil moisture suction, which as similar for all materials. Finite element studies the thermal strains that develop in a typical ivement showed that the thermally induced ten- e stresses in the base course are far in excess of pical tensile strengths for initially intact pave- ents. The surface course did not develop exces- ve stress levels. Freeze-thaw cycling produced astic deformations in all samples, and the per- anent expansion or contraction was related to e as-compacted total soil moisture suction. ese permanent deformations from freeze-thaw cling imparted a residual tensile stress to the phalt concrete. During a freeze, the suction in e sample showed a marked increase, often 10 to times the initial value. The suction then dropped low the initial value during the thaw cycle. This op was consistent regardless of the thermal ac- ity or plastic deformation. This indicated a reor- nization of the moisture in the sample, which y be related to strength losses caused by freeze- w cycling. The data in this study gave new in- ht into the mechanism of freeze-thaw in pave- nt deterioration. (See also W76-12451) (Sims - WS)

GINEERING PROPERTIES OF COM- CTED CLAY CONDITIONED BY SATURA- ON AND FREEZE-THAW CYCLES,
obil Research and Development Corp., Dallas, x.
A. Pagen, and V. K. Khosla.
Frost, Moisture, and Erosion; Transportation search Record 532, Transportation Research ard, National Research Council, Washington, C., p 14-29, 1975. 14 fig, 2 tab, 18 ref.

scriptors: *Highways, *Compacted soils, turated soils, *Freezing, Thawing, Saturation, ys, Soils, Roads, Road construction, Paving, oratory tests, Strength of materials, Tempera- e, Moisture content, Subsurface drainage, Civil ineering.
ntifiers: *Freeze-thaw cycling, Pavements, grade drainage.

s research quantitatively evaluated the effect saturation and freeze-thaw cycles on the logical characteristics of a compacted sub- le. Kaolin samples compacted by 25, 40, and 80 vs of a drop hammer were tested over a wide ge of moisture contents and densities. The ire and rheological parameters investigated relate to soil strength are unconfined com- sive strength, modulus of elasticity, creep dulus, and complex elastic modulus. Laborato- ompacted samples were saturated under con- ed boundary stress conditions in a specially gned chamber and were then subjected to nine ze-thaw cycles before testing. Results showed volumetric swelling, although less than the me of absorbed water, increases as compac- energy increases and that soil structure also ges under saturation and freeze-thaw cycles. logical parameter values seemed to be inde- lent of the compaction energy levels used. ults also showed that compacted cohesive sub- es exposed to saturation and freeze-thaw cy- in the field will experience major reductions in -carrying capacity. Therefore, it is recom- ded that the design of rigid and flexible pave- s over cohesive subgrades for areas in which c freezing and thawing occurs should focus er attention on providing adequate subgrade age so that initial saturation of the subgrade is nized. CASE STUDIES OF VARIATIONS IN SUB- GRADE MOISTURE AND TEMPERATURE UNDER ROAD PAVEMENTS IN VIRGINIA,
Virginia Highway and Transportation Research Council, Charlottesville.
N. K. Vaswani.
In: Frost, Moisture, and Erosion; Transportation Research Record 532, Transportation Research Board, National Research Council, Washington, D. C., p 30-42, 1975. 13 fig, 1 tab.

Descriptors: *Roads, *Moisture content, *Temperature, *Subsoil, *Virginia, Precipitation(Atmospheric), Highways, Road construction, Soils, Underground, Soil moisture, Strength of materials, Freezing, Subsurface drainage, Paving, Civil engineering.
Identifiers: Subgrades, Subgrade drainage, Pavements.

Changes in moisture under uncovered ground and in the subgrades of pavements were evaluated. The pavements ranged from new to about 10 years old. Moisture content was determined by a nuclear probe to determine moisture depth. The findings were as follows: (1) the higher the compaction and dry density of the subgrade soil were, the lower the moisture content would be; (2) subgrade moisture content increased sharply from the beginning to the end of construction; (3) for 1 or 2 years from the date of the subgrade construction, moisture content increased because of precipitation and after this time the rate of increase in moisture decreased; and (4) after about 10 years there was little increase in the subgrade moisture content. SATELLITE SNOW OBSERVATIONS AND SEASONAL STREAMFLOW FORECASTS,
National Aeronautics and Space Administration, Greenbelt, Md. Goddard Space Flight Center.
A. Rango, and V. V. Salomonson.
Final Report, January 1976, 19 p, 7 fig, 3 tab, 5 ref. NOAA Contract No. NA-776-74.

Descriptors: *Satellites(Artificial), Meteorology, *Remote sensing, Snow, *Snow cover, *Snowmelt, Streamflow, *Streamflow forecasting, Asia, Wyoming.
Identifiers: Satellite observations, Environmental satellite observations, Earth resources satellite observations, *Snow observations, *Indus River Basin(India), *Wind River Mountains(Wyo).

Relatively low spatial resolution (about 4 km) environmental satellite and high spatial resolution (80m) earth resources satellite data have been used to map snow-covered areas in the upper Indus River Basin in Pakistan and the Wind River Mountains in Wyoming. For the Indus River, early Spring snowcovered area measurements were obtained and compared to April through June total streamflow during the years 1967-1971. A linear regression equation quantitatively expressing the relationship had an r2 = 0.91. Prediction of the April-June 1972 streamflow using this equation produced an estimate that was within three percent of the actual total. Composited results from two years of data over seven Wind River Mountain watersheds indicated that Landsat-1 snowcover observations, separated on the basis of watershed mean elevation, were also related to seasonal runoff as expressed in the form of statistically significant regression equations. These results indicate that satellite-derived snowcovered area has the potential for becoming a useful input parameter for improved prediction of snowmelt runoff. (NOAA)

SOME REMARKS ON THE UNUSUAL BEAU- FORT SEA ICE CONDITIONS IN SUMMER 1975,
Alaska Univ., College. Geophysical Inst.
G. Wendler, and K. O. L. F. Jayaweera.
SG Report No. 76-7, Geophysical Inst. No. UAG R-246, May 1976. 28 p, 14 fig, 1 tab, 29 ref. SG No. 04-6-158-44039.

Descriptors: Weather, *Weather data, Ice, *Ice cover, *Sea ice, *Alaska, Arctic, Arctic Ocean, Sea water.
Identifiers: *Sea ice movement, *Ice thickness, Prudhoe Bay(Alas), *Beaufort Sea(Alas).

In the summer of 1975 the sea ice conditions between Point Barrow and Prudhoe Bay were the severest since 1898 when the ice did not move away from shore at all. In 1975 the movement started later than in any year since that time and was incomplete. From the meteorological point of view this event is very interesting and also had great economic ramifications because the need to resupply the Prudhoe Bay oil fields by barges could not be carried out as planned. These unusual ice conditions were caused by: (a) a thicker than normal ice cover for the winter of 1974-75 owing to a cold and snow-deficient winter; (b) a cooler than normal summer 1975 which not only slowed down the rate of ice decay but also shortened the period in which melting occurred, and (c) the unusual wind conditions in summer 1975 which were caused by a persistent low pressure system over the high Canadian Arctic for July, August, and September, adding a northwesterly wind component to the average wind which kept the ice near to shore. The last reason is believed to be the most important. (NOAA)

ESTIMATING GROUNDWATER EVAPOTRANSPIRATION FROM STREAM-FLOW RECORDS,
Geological Survey, Doraville, Ga.
J. F. Daniel.
Water Resources Research, Vol 12, No 3, p 360-364, June 1976. 5 fig, 10 ref.

Descriptors: *Evapotranspiration, *Groundwater, *Estimating, *Model studies, *Streamflow, Flow rates, Aquifer characteristics, Transmissivity, Surface-groundwater relationships, Hydrologic data, *Alabama.
Identifiers: *Indian Creek(Ala).

An analytical solution for the evapotranspiration rate from the aquifer system of a stream basin was applied to a selected basin despite large-scale violations of assumptions for the derivation. Rates computed represent losses from the groundwater bodies and do not include losses from soil moisture. The computed rate for the 23.00 sq km basin, Indian Creek near Troy, Alabama, during April and May 1963 was 0.037 cu m/sec, or about 0.5 cm/month. Such results should be reliable enough to use in rainfall-runoff models and, in the absence of more detailed data, in areal groundwater models. (Woodard-USGS)

A METHOD OF FINDING THE FAMILY OF RUNHYDROGRAPHS FOR GIVEN RETURN PERIODS,
Natal Univ., Durban (South Africa). Dept. of Civil Engineering.
L. A. V. Hiemstra, W. S. Zucchini, and G. G. S. Pegram.
Journal of Hydrology, Vol. 30, No. 1/2, p 95-103, May 1976. 6 fig, 5 ref.

Descriptors: *Hydrographs, *Hydrograph analysis, *Peak discharge, *Flood frequency, *Flow rates, Frequency analysis, Runoff, Hydrology, Design flood.
Identifiers: *Runhydrographs, *Vaal River(South Africa), *South Africa, Lognormal probability distribution, Return period, Exceedance probability, Run-theory.

Most observed flood hydrographs at a problem point are composite hydrographs. Expotential function describe both the rising and recession limbs of averaged composite hydrographs very well. These averaged composite hydrographs are called run-hydrographs because run-theory was used in the averaging process. A log transformation results in triangular shapes for runhydrographs. Runhydrographs are therefore fully defined in terms of times-to-peak and peak rates of runoff measured on and from a selected horizontal truncation level, respectively. A bivariate lognormal probability distribution for times-to-peak and peak rates of runoff is a satisfactory descriptor for the occurrence of runhydrographs. Parameters were estimated from 50 years of continuous instantaneous hydrograph record for the Vaal River at Standerton. Contours of equal probability of exceedance were calculated from the bivariate lognormal probability distribution which enables the extraction of a family of runhydrographs for any desired probability of exceedance. This capability enables the civil engineer to select the members of this family of most interest to his flood problem. (Lardner - ISWS)
W76-12195

DERIVATION OF TIME OF CONCENTRATION,
New Mexico Inst. of Mining and Technology, Socorro.
V. P. Singh.
Journal of Hydrology, Vol. 30, No. 1/2, p 147-165, May 1976. 4 fig, 8 ref.

Descriptors: *Time of concentration, *Runoff, *Precipitation intensity, *Watersheds(Basins), Continuity equation, Momentum equation, Equilibrium, Hydrology, Equations, Mathematical studies, Rainfall, Time.
Identifiers: *Space-time distribution, *Kinematic wave equation, Watershed characteristics, Method of characteristics, Plane sections, Converging sections.

Generalized expressions for the time of concentration are derived from the kinematic wave theory. Two types of geometric configurations are considered in the derivations: (1) rectangular plane section and (2) converging section. It was shown that under very special conditions the well-known Kirpich's formula for the time of concentration is a special case of the generalized expressions. Furthermore, it was shown that the rainfall duration has definite influence on the time of concentration - a fact that apparently has not been considered before. (Lardner - ISWS)

DISCHARGE PREDICTION, PRESENT AND FORMER, FROM CHANNEL DIMENSIONS,
Wisconsin Univ., Madison. Dept. of Geography.
G. H. Dury.
Journal of Hydrology, Vol. 30, No. 3, p 219-245, July 1976. 6 fig, 3 tab, 37 ref.

Descriptors: *Discharge(Water), *Channel flow, *Channels, Streams, Valleys, Velocity, Humid areas, Slopes, Beds, Meanders, Equations.
Identifiers: *Discharge prediction, *Channel dimensions, Underfit streams, Valley meanders, Empirical study, Power-functions, Slope factor, Bedwidth, Meander wavelength.

Discharge at the most probable annual flood can be predicted from the dimensions (including slope) of existing stream channels. The predicting technique was modified for application to former channels, all of which were considered unbraided. The analysis of formerly available data plus new data on bedwidth, meander wavelength, channel slope and discharge, in some cases, provided empirical confirmation of the theoretical relationships of channel to discharge, and in other cases produced results fully consonant with those relationships. Analysis confirmed a linear relationship, that extended through flume observations, between meander wavelength and discharge. Analysis also permitted the identification of stereotype numerical constants for use in the equations relating width, depth, velocity, slope, roughness and wavelength to the discharge of streams in humid regions. Allowance for cross-sectional area and channel slope resulted in a predicting equation that, tested against channels which discharge 395 cu m/s or less at the most probable annual flood, was highly successful in predicting for channels that carried 11,500 and 283,170 cu m/s at the same frequency. FLOOD DISCHARGE OF STREAMS IN NEW MEXICO AS RELATED TO CHANNEL GEOMETRY,
Geological Survey, Albuquerque, N. Mex.
A. G. Scott, and J. L. Kunkler.
Open-file report 76-414 June 1976. 29 p, 6 fig, 3 tab, 18 ref.

Descriptors: *Flood discharge, *Streams, *New Mexico, *Flood recurrence interval, *Flood forecasting, Flow rates, Gaging stations, Channel morphology, Hydrologic data, Evaluation.
Identifiers: Log-Pearson Type III

Results are described of a study relating flood characteristics to the reference width of the channel. Data from 79 gaging stations were used in these analyses. Stations were selected which would provide estimates of floods of a 10-year recurrence interval and at which channel-geometry could be adequately measured in the field. The discharges for recurrence intervals of 2, 5, 10, 25 and 50 years were determined for each station by the log-Pearson Type III method. The relation between the magnitude of floods of various frequencies and the reference width and main-channel slope was reliable with a standard error of about 65 percent for most of the areas of the State. 2F. Groundwater

ON THE GENERAL EQUATIONS FOR FLOW IN POROUS MEDIA AND THEIR REDUCTION TO DARCY'S LAW,
Princeton Univ., N. J. Dept. of Civil Engineering.
W. G. Gray, and K. O'Neill.
Water Resources Research, Vol. 12, No. 2, p 148-154, April 1976. 1 fig, 15 ref, append. NSF ENG75-16072 and NSF-RANN 6064.

Descriptors: *Groundwater, Equations, *Darcy's law, Mathematics, *Flow, Subsurface waters, Groundwater movement, Groundwater potential, Pore water, Energy equation, Momentum equation, Mathematical studies, *Porous media, Mass transfer, Convection, Dispersion.
Identifiers: *Equations of flow, *Newtonian fluid, General equations, *Isotropic media, Inertia.

A technique of local averaging was applied to obtain general equations which describe mass and momentum transport in porous media. The averaging was performed without significantly idealizing either the porous medium or the pertinent fluid mechanical relations. The resulting general flow equation was simplified to treat flow of a Newtonian fluid in a slowly deforming solid matrix for two special cases. For flow in an isotropic medium where convective and inertial terms are important, an equation was developed which is dependent only on five medium parameters which could be evaluated by experiment. Flow in an anisotropic medium was also analyzed, and the general equation was reduced to Darcy's law when the convective and inertial terms were neglected. (Prickett - ISWS)

HYDRODYNAMICS OF GROUNDWATER FLOW IN A FRACTURED FORMATION,
Birmingham Univ. (England). Dept. of Civil Engineering.
T. D. Streltsova.
Water Resources Research, Vol. 12, No. 3, p 405-414, June 1976. 9 fig, 3 tab, 31 ref, 1 append.

LIBRARY U. OF I. URBANA-CHAMPAIGN

Descriptors: *Groundwater movement, Hydrodynamics, *Equations, Fractures(Geologic), Hydraulic properties, Aquifers, Aquitards, Elasticity(Mechanical), Homogeneity, Heterogeneity, Drawdown, Testing, Pumping, Porous media, Fissures(Geologic), Graphical analysis, Mathematical studies, Rock properties.
Identifiers: *Fissure flow, *Pore flow, Recovery, Type curves.

Hydrodynamical aspects of groundwater flow in fractured formations and the basic hydraulic properties controlling the flow were considered. A brief literature survey on studying the physical characteristic of the fractured rocks and on developing an understanding on the mechanism of fluid flow in fracture formations constituted an introductory section. Basic definitions, relations, and assumptions given for subsequent interpretation of the flow behavior in a fissured rock then followed. Concepts of fractured, homogeneous, and heterogeneous water-bearing formations and their response mechanism to a pressure change were considered. The general differential equations for a flow in a fractured and in a heterogeneous formation of uniform anisotropy were derived. Two types of the flow behavior, fissure flow and pore flow, were distinguished. Two drawdown equations, respectively, for a flow in a fissure space, whether void or infilled with a fine material, and for a flow in a porous space to a well discharging at a constant rate in a fractured aquifer, were given. A fractured reservoir response to a pressure change due to pumping was illustrated by the field drawdown and recovery data. A particular case of a heterogeneous formation, an aquifer-aquitard system, was discussed, and the drawdown distribution in both aquifer and aquitard was given when account is taken of their elastic properties. G. Rodis, and L. F. Land.
Available from the National Technical Information Service, Springfield, Va., 22161, as PB-254 , $3.50 in paper copy, $3.00 in microfiche. Water-Resources Investigations 76-21, February 6. 12 p, 6 fig, 4 ref.

Descriptors: *Groundwater resources, *Aquifer characteristics, *Water yield, *Water quality, Hydrologic data, Groundwater movement, Water levels, Saline water intrusion.
Identifiers: Eastern Palm Beach County(Fla).

The shallow aquifer underlies all of Palm Beach County, Fla., and is the source of almost all freshwater supplies in the eastern part of the county. It consists of mixtures of sand, shell sandstone, and limestone. In this area the concentration of dissolved solids in the ground water usually does not exceed 500 milligrams per liter. A section of cavidolled limestone and other permeable rocks is exposed several miles inland and extends north to almost the entire length of the county. This section yields up to 2,000 gallons per minute of water to large wells and offers an excellent potential for the development of future ground water supplies. Sea-water intrusion into the shallow aquifer is a potential threat to several coastal well fields. The wells nearest the coast are most vulnerable. (Woodard-USGS)

GROUND-WATER RESOURCES IN THE LOMPOC AREA SANTA BARBARA COUNTY, CALIFORNIA,
Geological Survey, Menlo Park, Calif.
G. A. Miller.
Open-file report 76-138, April 1976. 78 p, 25 fig, 12 tab, 61 ref.

Descriptors: *Groundwater resources, *Aquifer characteristics, *Water yield, *Groundwater recharge, *Water quality, Water utilization, Hydrologic data, Data collections, Pumping, Water wells, Irrigation, Surface-groundwater relationships, Hydrogeology, Water level fluctuations, Chemical analysis, *California.
Identifiers: Lompoc area(Calif), Santa Barbara County.

Water supplies in the Lompoc plain in Santa Barbara County, Calif., are pumped from highly permeable gravel and sand, which make up the main water-bearing zone. The history of groundwater quality in the Lompoc area shows little change in the Lompoc upland and the Lompoc terrace, but an increase in the concentration of dissolved solids in the main water-bearing zone beneath the Lompoc plain. Most water pumped from this zone is used for irrigation and contains dissolved solids in concentrations ranging from less than 500 to more than 3,000 milligrams per liter (mg/liter). The average concentration is about 1,500 mg/liter. The total hardness is more than 1,000 mg/liter, and most of this water contains more than 750 mg/liter sulfate; the most abundant ions are calcium, sodium, sulfate, and bicarbonate. Changes in ground-water quality seem largely related to irrigation return; to inflow of native water of poor quality; to discharge of sewage effluent; and, in the shallow water-bearing zone, perhaps to the oxidation of sulfide minerals. Average annual recharge to ground water in the plain from the Santa Ynez River, local tributaries, underflow, and infiltration of rain is about 14,000 acre-ft. Discharge of ground water from the Lompoc plain is by pumping, evapotranspiration, streamflow, and underflow to the ocean. Pumpage during 1972 was about 23,000 acre-ft, less than half of which probably returned to the main water-bearing zone. (Woodard-USGS)

A SLUG TEST FOR DETERMINING HYDRAULIC CONDUCTIVITY OF UNCONFINED AQUIFERS WITH COMPLETELY OR PARTIALLY PENETRATING WELLS,
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
H. Bouwer, and R. C. Rice.
Water Resources Research, Vol. 12, No. 3, p 423-428, June 1976. 4 fig, 11 ref.

Descriptors: *Hydraulic conductivity, *Aquifer testing, *Aquifers, *Water wells, *Thiems equation, Water levels, Resistance networks, Analog models, Equations, Transmissivity, Water table aquifers, Water table, Potentiometric level, Permeability, Equilibrium.
Identifiers: *Slug test, Effective radius, Partial penetration, Equipotentials.

A procedure was presented for calculating the hydraulic conductivity of an aquifer near a well from the rate of rise of the water level in the well after a certain volume of water is suddenly removed. The calculation was based on the Thiem equation of steady state flow to a well. The effective radius R sub e over which the head difference between the equilibrium water table in the aquifer and the water level in the well is dissipated was evaluated with a resistance network analog for a wide range of system geometries. An empirical equation relating R sub e to the geometry of the well and aquifer was derived. It was discovered that the technique is applicable to completely or partially penetrating wells in unconfined aquifers; it can also be used for confined aquifers that receive water from the upper confining layer. The method's results were compatible with those obtained by other techniques for overlapping geometries. (Visocky - ISWS)

UNSTEADY FLOW TO A NONPENETRATING ARTESIAN WELL,
Singapore Univ. Dept. of Civil Engineering.
M. H. A. Khader, and D. Ramadurgaiah.
Ground Water, Vol. 14, No. 4, p 200-204, July-August 1976. 5 fig, 2 tab, 9 ref.

Descriptors: *Groundwater, *Artesian aquifers, *Water wells, *Drawdown, *Penetration, Equations, Mathematical studies, Unsteady flow, Steady flow, Aquifer testing, Groundwater movement, Wells.
Identifiers: *Nonpenetrating artesian wells, *Leaky artesian conditions, Type curves, Finite well diameter, *Laplace transformations, Response curves.

Exact solution to the problem of unsteady drawdown in a leaky artesian aquifer due to a constant discharge nonpenetrating well was presented. Finiteness of the well radius and aquifer anisotropy were considered in formulating the problem. The solution was derived on the assumption that the flux entering the pumped well was uniformly distributed over the plane circular bottom of the well. The aquifer was considered to be finite in thickness, but of infinite lateral extent. The flow of groundwater was assumed to be governed by Jacob's model of linear leakage. The Laplace transformation technique was employed in the theoretical development. The drawdown function was numerically integrated in terms of

dimensionless parameters of the flow system and the results were depicted in graphs. (Prickett-ISWS)

MULTIVARIATE ANALYSIS OF GEORGIA COASTAL PLAIN GROUNDWATERS,
Georgia Inst. of Tech., Atlanta. School of Geophysical Sciences.
C. O. Pollard, S. A. Mulaik, and W. S. Parks, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-257 839, $5.00 in paper copy, $3.00 in microfiche. Georgia Environmental Resources Center, Atlanta, Report No. ERC-0676, July 1976, 88 p, 16 ref, 16 append. OWRT A-063-GA(1). 14-31-0001-5010.

Descriptors: *Groundwater, *Georgia, Coastal plains, Water quality, Water chemistry, Acquifer characteristics, Geochemistry, Chemical analysis, Water analysis, Water wells, Silica, Hydrogen ion concentration, Fluorides, Brines, Limestone.
Identifiers: *Multivariate analysis, Cluster analysis, Factor analysis, Evaporites.

Chemical analyses of groundwaters from 589 Georgia Coastal Plain wells were cluster-analyzed (both hierarchically and non-hierarchically) using the major elements, depth, and locations as the 14 variables that had been measured on each well. Hierarchical clustering produced the most meaningful classification of these groundwaters, in that most of the 17 clusters obtained were restricted geographically and the geologic ages of the producing horizons were also somewhat restricted to known continuous aquifers. Discriminant analysis of the clustered data yielded discriminant functions for the classification of future wells and a ranking of the variables in terms of importance for distinguishing among clusters, SiO_2, pH, and F were the three most important chemical variables in this respect, and Cl and Na were the least important. Factor analysis of the clustered data revealed source variables (brine, limestone, evaporites, etc.) that account for observed correlated variations in the chemical analyses. Most of the waters appear to have equilibrated with their surroundings to the extent that they now identify their surroundings. The brine-contaminated waters found in the coastal area were identified and were split into levels of contamination. Timely and useful information about critical interactions within Georgia groundwaters was gained from available somewhat incomplete, data without the delays and expenses required for traditional hydrologic and geologic studies. The study has defined characteristics of waters in the clusters and the natural factors that affect those characteristics, both of which can be used as background for comparison of future environmental impacts and for predictions of effects of proposed groundwater recharge and coolant wells.

PEAT TEMPERATURE REGIME OF A MINNESOTA BOG AND THE EFFECT OF CANOPY REMOVAL,
Forest Service (USDA), Grand Rapids, Minn. North Central Forest Experiment Station.
J. M. Brown.
Journal of Applied Ecology, Vol. 13, p. 189-194, April 1976. 1 fig, 2 tab, 8 ref.

Descriptors: *Peat, *Bogs, Organic soils, *Soil temperature, *Water temperature, *Minnesota, *Climatology, Clear-cutting, Canopy, Streamflow, Water table.
Identifiers: Black spruce trees, Forested strips, *Peat temperature.

Temperatures, at four depths, were routinely measured in a strip-cut black spruce bog to determine the peat temperature regime and the effect of canopy removal. Peat temperatures were unaffected by removal of the canopy. Peat temperatures near the surface were closely correlated to climatic conditions while temperatures at a depth of 2 meters lagged several months behind the climatic regime. Outlet stream temperatures showed that streamflow originates primarily from the upper surface of the bog water table. (Forest Service)

FOREST SOILS AND THE ASSOCIATED SOIL-PLANT WATER REGIME,
Forest Service (USDA), Berkeley, Calif. Pacific Southwest Forest and Range Experiment Station.
J. L. Smith.
In: Isotopes and radiation of soil-plant relationships, including forestry, International Atomic Energy Agency, Vienna, Austria, p 399-412, 1972. 4 tab, 19 ref. Paper IAAE-SM-151/37.

Descriptors: Radioisotopes, *Soil water movement, Soil-water-plant relationships, *Tracers, *Pinus contorta, Transpiration, *Red fir trees, *Lodgepole pine trees, *Water budget, *Forest soils, Soil moisture, California.

In forest lands, maximum stream discharges, peak flows, soil erosion, plant growth and water yield improvement through vegetation change depend on the hydrologic regime of the soil. The use of radioactive isotopes has made it easier to trace water movement in soils and trees. The technique was used to measure water movement in soils on the Sierra Nevada of California and in two major tree species--red fir (Abies magnifica A. Murr.) and lodgepole pine (Pinus contorta Dougl.) - growing there. Water flow through a pyroclastic soil having porosities of 44 to 61% was traced by tritium and 32P. Water movement in these tree species in early spring when the soil was covered to a depth of 360 cm of snow ranged from 1.5 to 2m/h. Evapotranspiration could not be determined by measuring soil moisture because snowmelt quickly replenished soil moisture. Total water use by lodgepole pine was estimated by combining rates and area of water movement within tree stems. Estimates of water use ranged from 0.1 litre/h for long-term movement in winter to 30.6 litre/h for short-term movement in early spring during ideal transpiration conditions. The results suggest that coefficients for water balance formula based on the energy balance approach can be estimated by using data on water movement determined by isotope tracers. (Forest Service)

Identifiers: *Solute transport, *Reactive solute, *Soil columns, *Convective-dispersive equation, Pore velocities.

Mathematical solutions of the differential equation governing reactive solute transport in a finite soil column were developed for two specific cases: continuous solute input and pulse-type solute input at the soil surface. These solutions incorporated reversible linear adsorption as well as irreversible solute adsorption. The irreversible adsorption was expressed by a sink/source term which either may be a constant or may have a concentration-dependent form. The boundary condition used across the surface was that of the third type, which accounted for advection as well as dispersion. To illustrate the significance of using the proper boundary conditions, comparisions were made with two other mathematical solutions. It was concluded that the solution presented was highly useful for low pore flow velocities. For large pore velocities, all three solutions were in agreement. (Prickett - ISWS)

The effects of climate and water on roadway design, construction, and performance have always been of the highest importance. Without temperature changes, structural portions of

LIBRARY U. OF I. URBANA-CHAMPAIGN

oadway would be rather easy to design for an-
icipated loads as they would be if moisture
hanges were also not present. Therefore, the in-
ormation in this RECORD will be of interest to
oils and design engineers who are concerned with
ie performance of the roadway structure under
ariations of climate, temperature, and moisture.
he combined effects of moisture and temperature
esulting in frost action are generally considered to
e a problem in the northern states, but much
vidence has come to light to indicate that some
outhern states also have their problems. The
roblems may in fact be amplified by the higher
umber of freeze-thaw cycles that are encoun-
red. A study of the problems in west Texas
owed that a reorientation of particles and struc-
re occurs, which brings about residual tensile
ress in the asphalt concrete pavement surface.
nother study showed a sharp rise in subgrade
oisture during construction and immediately
ereafter. The rate of increase decreased and
veled off at about 10 years after construction.
ie particular care that must be taken to prevent
igration of subgrade fines into the permeable
se layer was pointed out. The measurement of
il moisture by remote methods is being aided by
e development of new measuring devices. A
udy of the filtration characteristics of one non-
oven fabric filer was presented. All of the papers
this RECORD make contributions toward a
lution to the problems of roadway soil moisture
d temperature variation. A single solution is not
plicable nationwide nor, in most cases, state-
de, but engineering judgment based on the con-
uing development of the state of knowledge will
oduce the most economic and satisfactory solu-
ns. (See W76-12452 thru W76-12460) (Sims -

alculate the permeability of a soil from the
ts of in situ constant- or variable-head tests,
nust know the intake factor for the porous tip
The intake factor for a cylindrical tip of a piezometer is a function of its length and diameter only. No rigorous relationship has yet been derived, but an accurate empirical formula based on the best fit and previously published numerical solutions expresses the intake factor in a dimensionless form as a function of the ratio of the length to diameter of the tip. When tests are carried out in a horizontally bedded cross-anisotropic deposit (e. g., a laminated lacustrine clay), the permeability, calculated by assuming isotropy, will have a value intermediately between the horizontal and vertical permeabilities. If the ratio of these permeabilities is known from laboratory or other tests, a correction factor may be applied to the permeability (assuming isotropy) to determine the coefficients of permeability in the horizontal and vertical directions. The correction factor, which is a function of both the ratio of intake length to intake diameter and the ratio of the coefficient of the permeability in the horizontal position to that in the vertical position, was presented in graphical form to enable quick determination of the directional permeabilities. Moisture content is an important parameter that controls the performance of earth materials. Because satisfactory techniques were not available, this study was undertaken to develop new instrumentation that could be permanently installed in highway substructures for long-term monitoring of moisture content. Moisture content determination requires that the amount of water and the dry weight in a given volume of soil be obtained. This study considered only the amount of water. A concept that involved the relationship between the amount of water in soil and the dielectric constant, an electrical property, was investigated. The electrical capacitance (C) of a pair of electrodes with moist material between them is related to the dielectric constant (K) by C = (ae)K, where a is a constant based on the geometry of the electrodes and e is the permittivity of the vacuum. So that instrumentation problems encountered in the measurement of capacitance and dielectric constant with laboratory methods used in the field could be overcome, the sensor electrodes and soil were incoprorated in the reasonance circuit whose frequency of oscillation is a function of the circuit components. The measured output was the difference between the frequency in soil and in an electronic reference substituted for the soil. The circuit design was first tested with the electrodes forming a container into which soil could be placed. Several configurations of the embedded sensor were designed and tested. The capacitance concept was useful for sensing change in the amount of moisture per unit volume of soil. (See also W76-12451) (Sims-ISWS)

NUCLEAR MAGNETIC RESONANCE SENSORS FOR MOISTURE MEASUREMENT IN ROADWAYS,
Southwest Research Inst., San Antonio, Tex.
G. A. Matzkanin, and C. G. Gardner.
In: Frost, Moisture, and Erosion; Transportation Research Record 532, Transportation Research Board, National Research Council, Washington, D. C., p 77-86, 1975. 13 fig, 1 tab, 4 ref.

Descriptors: *Soil moisture, *Instrumentation, *Soil moisture meters, Measurement, Nuclear moisture meters, Moisture meters, Nuclear magnetic resonance, Soils, Highways, Roads, Road construction, Equipment, Soil tests, Soil properties, Civil engineering, Laboratory tests, Equations.
Identifiers: Subgrade soils, Sensor.

The feasibility of practical instrumentation based on the nuclear magnetic resonance method was investigated to address the need for accurate, reliable moisture measurements in highway systems. A prototype of an implantable sensor that uses the pulsed nuclear magnetic resonance spin-echo technique was developed and subjected to laboratory verification. The sensor was 3 by 2 by 2.25 in (7.6 by 5.1 by 5.7 cm) and weighed about 3 lb (1.35 kg). It directly measured the mass of moisture present; to obtain the percentage of moisture required that soil density be determined by an auxiliary method. Experiments with bentonite, silica flour, and topsoil indicated that the sensor operated reliably, with an accuracy of approximately + or - 1% up to 25% moisture, + or - 2% up to 100% moisture, and + or - 4.5% up to 200% moisture. A dependence of sensor response on soil type necessitated calibration for each soil type. Organic matter and dissolved salt did not affect the sensor readings for bentonite, but organic matter had an effect for silica flour. All of the results obtained were qualitatively accounted for in terms of a simple moisture adsorption and bonding model. (See also W76-12451) (Sims-ISWS)

INVESTIGATION OF FILTRATION CHARACTERISTICS OF A NONWOVEN FABRIC FILTER,
Marks-Rosen, Inc., Knoxville, Tenn.
W. J. Rosen, and B. D. Marks.
In: Frost, Moisture, and Erosion; Transportation Research Record 532, Transportation Research Board, National Research Council, Washington, D. C., p 87-94, 1975. 6 fig, 2 tab, 7 ref.

Descriptors: *Subsurface drainage, *Filtration, *Filters, *Fabrics, Drainage, Roads, Highways, Road construction, Soils, Soil water, Soil aggregates, Seepage, Erosion, Laboratory tests, Permeability, Hydraulics, Subsurface flow, Subsurface waters.
Identifiers: *Nonwoven fabric filters, Mirafi 140.

The purpose of this study was to investigate the behavior of a nonwoven fabric filter in subdrainage applications. Experiments were restricted to a single fabric, Mirafi 140. Conventional aggregate filters were tested under compatible conditions to provide a basis of performance behavior. Experimental results indicated that the nonwoven fabric provides desirable performance under a relatively wide range of soil conditions. Hypotheses that relate to mechanisms controlling the behavior of the nonwoven fabric in subdrain applications were discussed. These mechanisms were, in turn, related to induced filtration and internal grading of the soil near the soil-fabric contact surface. (See also W76-12451) (Sims-ISWSs)

DETERMINATION OF DISPERSIVE CLAY SOIL ERODIBILITY BY USING A PHYSICAL TEST,
Texas Univ. at Arlington.
T. M. Petry, and T. A. Haliburton.
In: Frost, Moisture, and Erosion; Transportation Research Record 532, Transportation Research Board, National Research Council, Washington, D.C., p 95-104, 1975. 8 fig, 1 tab, 6 ref.

Descriptors: *Erosion, *Soil erosion, *Dispersion, Groundwater movement, Soils, Clays, Laboratory tests, Instrumentation, Measurement, Soil chemistry, Soil engineering, Soil strength, Soil properties, Road construction, Civil engineering.
Identifiers: *Dispersive clay soils, Erosion tests, Erodibility, Internal erosion.

This paper introduced a new physical test method for identification of dispersive clay soil behavior. The significance of this form of internal erosion and the need for such a test were discussed. An analysis of dispersive clay soil behavior was included as a base for understanding the physical erosion test. The theoretical background, apparatus, and process of the proposed physical erosion test were presented. Data for average percentage of erosion were determined during 142 tests on 18 samples of varied properties. Physical erosion test results were correlated with those determined by a chemical property method and the method of plotting soil chemical data on a graph that has empirically derived zones of dispersive clay soil behavior. Correlations achieved were significant. It was concluded that dispersive clay soil behavior depends on the particular combination of chemical, physical, and mineralogical properties of the soil. The physical erosion test and the erosion device used were shown to provide the measure of dispersive clay soil erodibility needed by soils engineers to predict accurate field behavior. ON PHILLIPS' THEORY OF EQUILIBRIU RANGE IN THE SPECTRA OF WIN GENERATED GRAVITY WAVES,
Akademiya Nauk SSSR, Moscow. Institut O anologii.
S. A. Kitaigordskii, V. P. Krasitskii, and M. M. Zaslavskii.
Journal of Physical Oceanography, Vol 5, No 3 410-420, July 1975. 4 fig, 13 ref, 1 append.

Descriptors: *Wind tides, *Deep water, *Grav waves, *Distribution patterns, *Energy, Anal cal techniques, Theoretical analysis, Dispersi Model studies, Shallow water, Waves(Water).
Identifiers: *Spectral analysis, *Phillips' theo Random perturbations, Wave spectrum, Equili um range.

According to O. M. Phillips (1958, 1966) space time scale ranges can exist in the spectra of wi generated gravity waves within which the ene distribution must depend only on physical para ters characterizing the formation of sharp crest breaking waves. It was recently shown by Ban and Phillips (See W76-09874) that when l waves move across the surface there is a nonlin augmentation of the surface drift near the lo wave crests, so that short waves, superimposed the longer ones, can attain a reduced value of m imum amplitude at the point of incipient break This dynamical effect is in clear contradiction w the initial statement of Phillips' hypothesis on s tial equilibrium spectra. This fact, together w the effect of strongly intermittent nature of sh wave components, must be taken into accoun order to obtain a more complete and deta description of the high-frequency parts of wind-generated gravity wave spectrum. vestigation of populations of Daphnia rosea, D. rocurva, and Diaphanosoma leuchtenbergium in Sunfish Lake, southern Ontario (Canada), ring 1969 indicated that, in the absence of predan, food supply was the major factor controlling pulation size and influencing population rameters. Generally with each species, a populan peak was preceded by a rise in fecundity, an rease in birth rate, and a fall in death rate. As carrying capacity of the environment in terms food was surpassed in the population numbers lined, fecundity dropped off and the death rate e. A strong negative correlation between fecun- and death rate was observed.--Copyright 5, Biological Abstracts, Inc.

Akademiya Nauk URSR, Kiev. Inst. of Hydromechanics.
V. M. Sabodash.
Gidrobiol Zh. 10(6), p 93-96, 1974.

Descriptors: *Sulfates, *Larval growth stages, Larvae, Fish, Metabolism, Calcium, Fish management.
Identifiers: Ctenopharyngodon-idella, Minerals, *Zinc sulfate, *White amur.

The effect of zinc sulfate on the larval development stages of the white amur (Ctenopharyngodon idella) and the viability of larval changes as a result of this effect, with different contents of Ca in the water, were studied. Zn promotes incorporation in metabolism of Ca from the environment. The use of zinc sulfate during incubation of eggs and rearing the larvae of valuable fish species increased the fitness of their offspring which ultimately increases the yield of stocking material.--Copyright 1975, Biological Abstracts, Inc.

Descriptors: *Geomorphology, *Colorado, *Erosion, *Sediments, Sediment transport, Mudflow, Runoff, Topography, Rivers, Channel erosion.
Identifiers: *Alpine denudation, *Hillside erosion, Potential energy.

The use of geomorphic work as a measure of erosion intensity is illustrated. This allows direct comparisons of the effectiveness of erosion processes with other environmental exchages of energy or material and with relief factors. Because the measure facilitates the comparison of the results of fluvial and hillslope processes, it should be especially useful in situations where a geomorphic system can not be assumed to be in a steady state. An example from an alpine area in southwestern Colorado was used to illustrate the use of geomorphic work as a measure of erosion and to show how it may be compared to other environmental exchanges of material and energy. Identifiers: *Unit stream power equation, *Sediment concentration(Rivers), Niobrara River(Neb), Coup River(Neb), Mountain Creek(SC).

The usefulness of a sediment transport equation to engineering depends on its applicability to natural rivers. Data collected from six river stations were used to compare the applicability of different equations. These comparisons indicated that the dimensionless unit stream power equation is the one which can provide accurate predictions of total sediment discharge in natural rivers under diversified flow and sediment condition. The limitations to which this dimensionless unit stream power equation can be applied are explained. (Lardner - ISWS)

MINERALOGY AND RELATED PARAMETERS OF FLUVIAL SUSPENDED SEDIMENTS IN NORTHWESTERN OHIO,
Guelph Univ., (Ontario).
G. J. Wall, and L. P. Wilding.
Journal of Environmental Quality, Vol. 5, No. 2, p 168-173, April-June 1976. 4 fig, 3 tab, 29 ref.

Descriptors: *Ohio, *Lake Erie, *Fluvial sediments, *Mineralogy, *Clay minerals, *Sediments, Physical properties, Water quality, Chemical properties, Water properties, X-ray diffraction, Quartz, Organic matter, Pesticides, Soil erosion, Trace elements, Silts, Fluvial sediments, Soil erosion, Suspended solids.
Identifiers: *Maumee River basin(Ohio), Blanchard River(Ohio), Outlet Creek(Ohio), Auglaize River(Ohio), *Suspended sediments, Sediment origin, Clay mineralogy, Northwestern Ohio, Mica, Carbonate mineralogy, Soil particles, Sediment pollution.

Stream water samples were collected weekly for 17 months at eight sampling sites in the Maumee River Basin to characterize the clay mineralogy of the suspended sediments and to determine the utility of mineralogy as a marker of the source (rural, urban, geologic) of the sediments. X-ray diffraction analysis of the clay-sized (less than or equal to 2 micrometers) sediments indicated little seasonal or downstream variability in clay mineral composition. The quantities of mica, quartz, and vermiculite-chlorite were 36 + or - 5%, 29 + or - 5%, and 20 + or - 5%, respectively. The quantities of expandables, interstratified, and kaolinite minerals were usually less than or equal to 10%. The 2 to 50 micrometer fraction was dominated by quartz in high flow periods and secondary calcite in low flow periods. When fluvial suspended sediment properties were compared to properties of regional soil materials, mineralogy appeared to be a useful index to differentiate between surficial and geologic (parent material) sources of suspended sediments. The mineralogical characterization of the fluvial suspended sediments in combination with chemical data led to the conclusion that the annual suspended sediment load of the Maumee River and tributaries was predominantly surficial in origin. CHEMICAL CHARACTERISTICS OF THE MAJOR THERMAL SPRINGS OF MONTANA,
Geological Survey, Menlo Park, Calif.
R. H. Mariner, T. S. Presser, and W. C. Evans.
Open-file report 76-480, July 1976. 31 p, 2 fig, 10 tab, 26 ref.

Descriptors: *Geothermal studies, *Thermal springs, *Water chemistry, *Stable isotopes, *Montana, Water temperature, Warm springs, Hot springs, Deuterium, Oxygen isotopes, Carbon dioxide, Nitrogen, Argon, Hydrogen ion concentrations.
Identifiers: Aquifer temperatures, Geothermometers.

Twenty-one thermal springs in western Montana were sample for chemical, isotope, and gas compositions. Most of the springs issue dilute to slightly saline sodium-bicarbonate waters of neutral to slightly alkaline pH. A few of the springs issue sodium-mixed anion waters of near neutral pH. Fluoride concentrations are high in most of the thermal waters, up to 18 milligrams per liter, while F/Cl ratios range from 3/1 in the dilute waters to 1/10 in the slightly saline waters. Most of the springs are theoretically in thermodynamic equilibrium with respect to calcite and fluorite. Nitrogen is the major gas escaping from most of the hot springs; however, Hunters Hot Springs issue principally methane. The deuterium content of the hot springs waters is typical of meteoric water in western Montana. Geothermal calculations based on silica concentrations and Na-K-Ca ratios indicate that most of the springs are associated with low temperature aquifers (less than 100 degrees C). Chalcedony may be controlling the silica concentrations in these low temperature aquifers even in 'granitic' terranes. (Woodard-USGS)

MASS TRANSPORT IN GRAVITY WAVES ON A SLOPING BOTTOM,
Technische Hogeschool, Delft (Netherlands). Dept. of Civil Engineering.

LIBRARY U. OF I. URBANA-CHAMPAIGN

E. W. Bijker, J. P. Th. Kalkwijk, and T. Pieters.
Report 75-1. 125 p, 17 fig, 3 tab, 17 ref, 3 append.

Descriptors: *Sediment transport, *Coasts, *Ocean waves, *Velocity, *Hydraulics, Movement, Laboratory tests, Analytical techniques, Roughness(Hydraulic), Model studies, Gravity waves, Waves(Water), Slopes, mathematical models.
Identifiers: *Wave theory, *Drift velocities, Mass transport.

The influence of bottom slope on mass transport by progressive waves was investigated, both theoretically and experimentally. Theoretical considerations, based on linear wave theory, show the greatest influence of the slope on the bottom drift velocities for relatively long waves and steep slopes. The bottom drift velocities are most important for sediment transport in coastal areas. Experiments were carried out on three sloping bottoms. The general conclusions were: (1) the mass transport velocities at the bottom on the slopes seem to be determined by the local depth rather than by the slope-angle; (2) these velocities, predicted by the horizontal bottom theory, are too large for the sloping bottom; (3) the discrepancy between theory and experiment increases with decreasing depth and increasing relative wave length and wave height; (4) the inclusion of the change in wave form and slope effect appears to explain the behavior of the bottom velocities qualitatively; and (5) the drift velocities change slightly for increasing bottom roughness and considerably when a ripple-like roughness is present. (Singh - ISWS)

AN ORTHOGONALIZED CONVOLUTION METHOD OF TIDE PREDICTION,
Hawaii Inst. of Geophysics, Honolulu.
G. W. Groves, and R. W. Reynolds.
Journal of Geophysical Research, Vol. 80, No. 30, p 4131-4138, October 20, 1975. 4 fig, 5 tab, 12 ref. NSF GA-1117, GA-17137.

Descriptors: *Tides, *Oceans, *Analysis, *Hawaii, Gravity, Estuaries, Tidal effects, Equations, Diurnal, *Forecasting.
Identifiers: *England, *Tidal analysis, Tidal prediction, Orthogonal functions, Orthotides, Tidal admittance, Convolution method, Harmonic method.

Linear combinations of a set of special orthogonal tidal functions, referred to as orthotides, were proposed to represent the tidal input functions and the observed tide. These functions differed from the usual harmonic functions in that successive members correspond to successively more wiggly terms in the linear admittance function. As in convulotion method, the appropriate tidal constants were determined from the mean displaced products of the observed tide with the tidal input functions. Munk and Cartwright's analyses of 19 years of data from Honolulu, Hawaii and Newlyn, England were used to estimate the linear gravitational orthotide constants for those locations. The general decrease of magnitude with order of the orthotide constants indicated that the tidal admittance was relatively smooth. A procedure was outlined for a similar development of the bilinear tidal response. This orthogonal method was suggested for routine analysis and prediction. (Adams - ISWS)

THERMAL ANALYSIS OF FROZEN EMBANKMENT ISLANDS,
Puget Sound Naval Shipyard, Bremerton, Wash.
G. R. Bafus, and G. L. Guymon.
Journal of the Waterways, Harbors and Coastal Engineering Division, American Society of Civil Engineers, Vol. 102, No. WW2, Proceedings Paper 12139, p 123-139, May 1976. 7 fig, 25 ref, 2 append.

Descriptors: *Coastal engineering, *Islands, Oil wells, *Alaska, Freezing, *Offshore platforms, Ice, Equations, Sea ice, Shores, Coasts, Temperature, Cold regions, Cold weather construction, *Model studies, Mathematical models, *Finite element analysis, Structures, Mathematical studies, Civil engineering, Meteorology
Identifiers: *Man-made islands, *Barter Island(Alaska).

A two-dimensional finite element analysis of the thermal state of man-made frozen islands was presented. The model included an air-ground interface energy exchange simulator that incorporated available meteorological parameters for application to offshore areas in the Alaskan arctic. Comparison of simulations with analytical and available data indicated an accurate and efficient model. Two hypothetical island configurations were analyzed using actual meteorological data obtained at Barter Island, Alaska. Results suggested that islands constructed of dredged materials are feasible in shallow waters. (Sims - ISWS)

INCREASING THE MEAN CURRENT IN COASTAL CHANNELS,
Rosenstiel School of Marine and Atmospheric Science, Miami, Fla.
J. van de Kreeke.
Journal of the Waterways, Harbors and Coastal Engineering Division, American Society of Civil Engineers, Vol. 102, No. WW2, Proceedings Paper 12157, p 223-234, May 1976. 7 fig, 4 tab, 8 ref, 1 append.

Descriptors: *Channels, *Currents(Water), *Inlets(Waterways), *Tidal waters, Tides, Estuaries, Laboratory tests, Equations, Mathematical studies, Weirs, Flow.
Identifiers: *Waterways, Flushing, River currents, Tidal currents.

Results of previously published theoretical studies suggest that properly designed inlets and channel constrictions, or both, can considerably increase the mean current in coastal channels. This was further investigated by laboratory experiments in a channel of uniform width and depth at each end connected to the same tidal basin. A mean current was induced by providing one end of the channel with a constriction in the form of a submerged weir. Measured values for the mean current were in good agreement with values obtained by numerical integration of the governing hydrodynamic equations. For each experiment, the direction of the mean current was the same for each point in the vertical. The direction of the mean current was not the same for all experiments. To aid in the interpretation of the results, an approximate analytic expression for the mean current was derived. (Lee - ISWS)

SAND LEVEL CHANGES ON TORREY PINES BEACH, CALIFORNIA,
Scripps Institution of Oceanography, La Jolla, Calif.
C. E. Nordstrom, and D. L. Inman.
Available from the National Technical Information Service, Springfield VA 22161, as ADA-019 833, $6.75 in paper copy, $3.00 in microfiche. U. S. Army Corps of Engineers, Coastal Engineering Research Center Miscellaneous Paper No. MP-11-75, December 1975. 166 p, 10 fig, 10 ref, 8 append. DACW72-72-C-0020.

Descriptors: *Waves(Water), *Seasonal, *Water levels, *Beaches, Resources development, *Environmental effects, *Sediment transport, *Sea level, Coasts, Beach erosion, Sands, *California.
Identifiers: *Outer Continental Shelf, *Beach profiles, Wave regime, *Torrey Pines Beach(Calif).

Three parallel range lines were established along a straight beach at Torrey Pines, California, and were surveyed at monthly intervals during June 1972 to May 1974. Offshore sand level changes were measured using reference rods placed in the bottom at selected stations on each range line. Beach profile measurements indicate that the beach underwent seasonal changes in configuration which are related to changes in the wave regime. During the summer months the beach profile progressively changed with the seaward progradation of the berm crest by sand accretion. This change was caused by onshore transport of sand from immediately offshore depths of less than -20 feet (-6.1 meters) relative to MSL. The transition from the summer to the winter beach profile was abrupt with the coincident occurrence of high waves and tides. Periods of high waves during high tides resulted in wave swash overtopping the berm crest and quickly eroding the beach. The rapid shoreward retreat of the berm crest caused by the offshore transport of sand was accompanied by a corresponding deposition of sand offshore at depths less than -30 feet (-9 meters) relative to MSL. (Sinha-OEIS)

MESOSCALE SPATIAL AND TEMPORAL VARIATIONS OF WATER MASS CHARACTERISTICS IN THE CALIFORNIA CURRENT REGION OFF MONTEREY BAY IN 1973-1974,
Naval Postgraduate School, Monterey, Calif.
R. E. Blumberg.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA-019 283, $6.00 in paper copy, $3.00 in microfiche. Master's Thesis, September 1975. 142 p, 19 fig, 2 tab, 10 ref, 8 append.

Descriptors: Water properties, *Currents(Water), *California, Data processing, *Profiles, Coasts, Bays, *Pacific Ocean, *Salinity, Water temperature, *Variability, Spatial distribution, Temporal distribution.
Identifiers: *California Current system, Mesoscale variations, Water masses, *Monterey Bay(CA), Salinity profiles.

Continuous salinity and/or temperature profiles were made off the coast of Monterey Bay monthly between August 1973 and August 1974 and on a spatial grid finer than is conventionally used. A procedure is described to convert the data from analog to digital form, process these data on an IBM 360 computer, and print out the results by station for each month. The results show water mass features of small spatial scale detectable only because of the small grid spacing. A gyre or filament structure is suggested by the north to south variation between lines of stations. The extent of the area of survey is insufficient to describe completely the water mass structure on both the eastern and western boundaries; however, the temporal variation in the observed water mass structure is consistent with the three oceanographic seasons described for the California Current system. Elements of relatively cold water and relatively warm water masses are identified in the area of survey. (Sinha-OEIS)
W76-12386

MESOSCALE COMPONENT OF THE GEOSTROPHIC FLOW AND ITS TEMPORAL AND SPATIAL VARIABILITY IN THE CALIFORNIA CURRENT OFF MONTEREY BAY IN 1973-74,
Naval Postgraduate School Monterey, Calif.
R. E. Greer.
Available from the National Technical Information Service, Springfield, Va 22161 as AD-A019 284, $7.50 in paper copy, $3.00 in microfiche. Master's Thesis, September 1975. 179 p, 13 ref.

Descriptors: *Continental Shelf, Water property, *Flow characteristics, *Currents(Water), *California, Water resources, Salinity, Water circulation, *Pacific Ocean, Variability, Spatial distribution, Temporal distribution.
Identifiers: *Outer Continental Shelf, *Geostrophic flow, *Bottom topography, Seasonal variations, Mesoscale component, Surface currents, Salt transport, *Monterey Bay(CA).

The mesoscale components of the geostrophic flow and its temporal and spatial variability are discussed for the oceanic region west of the continental shelf off Monterey Bay. The results were obtained from spatially dense observations on thirteen cruises between August 1973 and August 1974. Patterns of current flow indicated by drogues and geostrophy tend to confirm an analysis of the structure which has alternating element of poleward and equatorward flow. Surface current flow patterns are similar to those found at depths to 375 m. The bottom topography influences the direction of flow inside the 1,000 fathom curve. Seasonal variations of the geostrophic flow and salt transport were congruent with Skogsberg's (1936) annual cycle composed of three distinct oceanographic seasons. The flow and structure in the area are complex with flow elements less than 10 km in width. The data suggest that observations on a sampling grid length less than 10 km transverse to the current flow, and extensive independent current measurements are required to describe adequately the small-scale features of the flow, structure and its time variations. AN ALTERNATE GRAZING HYPOTHESIS FOR THE PATUXENT ESTUARY,
Maryland Univ., Solomons. Chesapeake Biological Lab.
D. R. Heinle.
Chesapeake Sci. 15(3), p 146-150, 1974.

Descriptors: *Maryland, Estuaries, *Energy budget, Copepods, *Jelly fish, Phytoplankton, Zooplankton, *Fish food organisms.
Identifiers: *Ctenophore, *Patuxent estuary(Md).

A substantial error in an earlier paper led Miller and Williams to conclude that there was insufficient phytoplankton and zooplankton in the Patuxent estuary, Maryland, to support the populations of ctenophores and jellyfish. Calculations of a revised energy budget suggests that there may, at times, be insufficient zooplankton, but that phytoplankton stocks are more than adequate for the needs of the ctenophores, the jellyfish and the copepods.--Copyright 1974, Biological Abstracts, Inc.

INFLUENCE OF SURFACE WAVES ON SUBSURFACE CURRENT MEASUREMENTS IN SHALLOW WATER,
National Oceanic and Atmospheric Administration, Seattle, Wash. Pacific Marine Environmental Lab.
D. Halpern, and R. D. Pillsbury.
Limnology and Oceanography, Vol. 21, No. 2, p 611-616, July 1976. 5 fig, 12 ref. NSF GS-28746, GS-33502, AG-299.

Descriptors: *Ocean currents, *Ocean circulation, *Pacific Ocean, *Oregon, Coasts, Continental shelf, *Currents(Water), Current meters, Time series analysis, On-site investigations, Measurement, *Waves(Water).
Identifiers: *Aanderaa current meters.

Aanderaa current-meter readings were taken at 43 m at two sites 0.2 km apart in water 50 m deep near the central Oregon coast. The uppermost extensions of the subsurface moorings were about 3 and 18 m deep. During a 25-day period in July and August 1973, mean speeds differed by about 47%. For low frequencies (less than 0.7 cph) there was a 1:1 correspondence between the shapes of the kinetic-energy density spectra. For all frequencies, spectral density estimates of the data recorded beneath the deeper placed topmost float were lower than the estimates of the other data. The effect of surface wave motion on Aanderaa current measurements was discussed. (Sims - ISWS)

WATER PRODUCTION FUNCTIONS AND PREDICTED IRRIGATION PROGRAMS FOR PRINCIPAL CROPS AS REQUIRED FOR WATER RESOURCES PLANNING AND INCREASED WATER USE EFFICIENCY,
California Univ., Davis. Dept. of Water Science and Engineering.
J. I. Stewart, R. M. Hagan, and W. O. Pruitt.
Final Report No. 14-06-D-7329, July 1976. 80 p, 17 fig, 18 tab, 17 ref. USBR 14-06-D-7329.

Descriptors: Irrigation programs, Water requirements, Optimization.
Identifiers: *Evapotranspiration, Crops, Beans, Planning, *Irrigation efficiency, Crop production, Water supply, Alfalfa, Grain sorghum, Water utilization.

1973 was a 'payoff' year in that procedures developed with corn in the 1969-72 period enabled gathering of all desired data for pinto beans in the single year, as well as finalizing information for grain sorghum. Alfalfa studies constituted the first year with a perennial crop having an established root system. Nevertheless, this experiment also provided information useful for practical water use planning. Principal developments for pinto beans, grain sorghum, and (earlier) corn are: (1) Yield versus evapotranspiration (ET) functions which quantify minimum yield loss expectations at all ET deficit levels. In relative value form these functions are transferable for guidance of several kinds of crop and water management decisions at other sites. Their use to select among crops for profit maximization in differing water supply circumstances is illustrated. (2) Determination of sensitivities of crop growth stages to ET deficits. (3) Methods of estimating expected ET deficits in different cropping circumstances. (4) Two models which utilize estimates of anticipated ET deficits and growth stage sensitivities to predict actual ET and yield for the season. Alfalfa soil water uptake patterns are used to illustrate calculation frequencies required to satisfy ET demands, based on soil depth and water holding capacity. (Bureau of Reclamation)

EVERY-OTHER FURROW IRRIGATION OF CORN,
Nebraska Univ., Lincoln. Dept. of Agricultural Engineering.
P. E. Fischbach, and H. R. Mulliner.
Transactions of the American Society of Agricultural Engineers, Vol. 17, No. 3, p. 426-428, May-June 1974. 4 tab, 9 ref.

Descriptors: *Corn(Field), *Irrigation practices, Irrigation effects, *Irrigation efficiency, *Furrow irrigation, Surface irrigation, Agriculture, Water conservation.

Every-other furrow irrigation was compared with every furrow irrigation on several soil types in Nebraska under various rainfall conditions. Analysis of the data shows no significant differences at the 5 percent level in corn grain yields on any soil texture when comparing every-other furrow with every furrow irrigation using 2 1/3 to 12-hr. irrigation sets. Further analysis of the data shows that the irrigation water moves laterally from the irrigated furrow to the adjacent dry furrow to a depth of 3 feet even with a 2 1/3-hr. irrigation set. Therefore, both manually and automated irrigation systems can be designed for every-other furrow irrigation. (Skogerboe-Colorado State)

FUNDAMENTALS OF PROGRAMMED SOIL MOISTURE DEPLETION,
Nebraska Univ., Mitchell. Scotts Bluff Experiment Station.
D. W. Fonken, and P. E. Fischbach.
Presented at 1974 Winter Meeting of the American Society of Agricultural Engineers, December 10-13, 1974. Chicago, Illinois. 4 fig, 11 ref.

Descriptors: *Scheduling, Soil moisture, Water utilization, Irrigation, Irrigation practices, Irrigation operation and management, Energy.
Identifiers: *Soil moisture depletion, *Irrigation scheduling.

Programmed soil moisture depletion is an irrigation scheduling policy for achieving improved water use efficiency and energy savings. It requires medium or fine textured soils, irrigation hardware that can apply small controlled amounts of water, a climate and/or irrigation supply which can provide off-season rainfall and irrigation, and a relatively high level of irrigation management. It is recommended as a technique to reduce peak season irrigation requirements by utilizing previously wasted rainfall and off-season irrigation capability. (Skogerboe-Colorado State)

SPRINKLER IRRIGATION DESIGN CRITERIA FOR SUGAR BEETS,
Nebraska Univ., Mitchell. Scotts Bluff Experiment Station.
D. W. Fonken, J. C. Steele, and P. E. Fischbach.
Transactions of the American Society of Agricultural Engineers, Vol. 17, No. 5, p 889-891, September-October 1974. 5 tab, 7 ref.

Descriptors: *Sprinkler irrigation, *Irrigation design, Irrigation practices, *Design criteria, *Sugar beets, Consumptive use, *Nebraska, Crop response.

A solid set sprinkler system was used to simulate center pivot sprinklers in a search for the smallest design capacity which would not reduce yields of irrigated sugar beets. The peak daily consumptive use of sugar beets in western Nebraska is about 0.33 in. per day. A system with the capacity to supply this amount to the crop would need a capacity in excess of 0.33 in. per day to allow for water losses. The results indicate that systems that can apply 0.20 in. per day, without allowing for water losses, are sufficient to produce sugar beets in western Nebraska without incurring a reduction in yield. FILTER ESPECIALLY INTENDED FOR FILTERING NATURAL WATER FOR THE IRRIGATION OF CULTIVATED FIELDS,
B. L. Legras.
U. S. Patent No. 3,959,140, 6 p, 6 fig, 11 ref; Official Gazette of the United States Patent Office Vol 946, No 4, p 1741, May 25, 1976.

Descriptors: *Patents, +Irrigation, *Irrigation practices, *Filtration, *Irrigation efficiency, Application equipment, Water delivery, *Filters, Screens, Water quality control.

A cleansable filter intended for filtering natural water for the irrigation of cultivated fields is described. The filter comprises a cylindrical body a filtering element mounted inside the body and defining in the interior two concentric chambers one communicating with the exterior through a drainage valve, and also through one of two lateral openings in the body. The other annular chamber encloses the first chamber and connects with the exterior through the other lateral opening. The filter also has a brush mounted coaxially in the first chamber. The brush rotates manually or automatically to remove all foreign bodies from the inner wall of the first chamber. Water enters the annular chamber through a lateral opening, passes into the first cylindrical chamber and through the filtering elements from the interior to the exterior and leaves by the second lateral opening. Foreign matter can be evacuated by opening the drainage valve. Alternatively, the brush may be driven by a device responsive to the pressure difference between the two chambers, the drainage valve being automatically opened at the same time. (Sinha - OEIS)

Identifiers: *Cost effectiveness, Branch and bound backtracking routine, *Muskingum flood routing procedure.

The Muskingum flood routing procedure together with a branch and bound backtracking optimization routine are used to evaluate alternative capacities and locations of various flood control structures required to protect a flood plain from a specified design flood. This paper describes this preliminary planning procedure and illustrates its use for estimating cost-effective combinations of flood storage capacities in reservoirs, temporary flood storage basin capacities, levee locations and heights, and increased channel capacities in river basin systems. Computational efficiency is necessary if the procedure is to be used many times to estimate the costs required to protect various regions in the flood plain from various design floods and to determine the required accuracy of various economic, hydrologic and design parameters for use in more detailed planning studies. The model developed can be extended to include a distribution of floods rather than a single design flood. This would permit an estimation of the cost of simultaneously providing different levels of flood protection to different regions in the flood plain. (Bell-Cornell)

FLOOD DAMAGE REDUCTION POTENTIAL OF RIVER FORECAST SERVICES IN THE CONNECTICUT RIVER BASIN,
National Weather Service, Silver Spring, Md. Office of Hydrology.
H. J. Day, and K. K. Lee.
NOAA Technical Memorandum NWS HYDRO-28, February 1976. 52 p, 16 fig, 9 tab, 11 ref.

Descriptors: *Connecticut, *Vermont, *Massachusetts, Connecticut River, *Flood damage, *River forecasting, Hydrologic data, Flood plains, Warning systems, Classification, Cost-benefit ratio, Topography mapping, Flood protection.
Identifiers: *Flood damage reduction potential, *River forecast services, *Connecticut River basin, Flood plain management, Reducible damage, Flood damage centers, Topographic data collection.

Four carefully selected communities in the Connecticut River Basin were studied for flood damage reduction. Properties on the flood plain were classified into residential, commercial, industrial and automobile categories. Stage damage assessments were made for those categories for four situations: no warning, limited warning time, maximum practical evacuation, and floodproofing of one-story houses. The investigation found that approximately $750,000 of reducible damages could be expected on commercial and residential elements of the flood plain. Industrial structures were classed in the same order of magnitude as residential and commercial structures. Total basinwide reducible damages exceeded $1,500,000 per year. The 1976 cost of the National Weather Service for providing river forecasts throughout the basin was approximately $75,000. It was estimated that a total of $200,000 per year was adequate to provide forecast services associated with reducible damages. (Roberts - ISWS)

EFFECT OF SEEPAGE ON EMBANKMENT DEFORMATIONS DUE TO WATER LOADING,
Sydney Univ. (Australia). School of Civil Engineering.
J. P. Carter, H. G. Poulos, and J. R. Booker.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-242 450, $3.50 in paper copy, $3.00 in microfiche. Research Report No. R256, December 1974. 18 p, 7 fig, 1 tab, 7 ref.

Descriptors: *Embankments, *Earth dams, *Seepage, *Deformation, Soil water, Soil water movement, Drainage, Drainage practices, Soil stability, Soil stabilization, Soil mechanics, *Finite element analysis, Membranes, Mathematical studies, Impervious membranes, Dams, Pore pressure, Movement.
Identifiers: *Embankment deformations, Drainage blanket, Homogeneous dam.

A finite element analysis was made of the movements in an embankment due to water loading, taking account of seepage through the embankment. The effects on deformations of drainage within the embankment and of a central core were investigated for an embankment resting on a rigid base. It was found that the long-term deformations due to water loading may be considerably affected by the pattern of steady state flow, and hence by the provision of drainage within the embankment. Larger horizontal movements were developed when seepage occurred than if an impermeable membrane existed on the upstream face. The modulus of the core relative to the shells also had a significant effect on movements. (Sims - ISWS)

SOME ASPECTS OF STOCHASTIC RESERVOIR THEORY,
Monash Univ., Clayton (Australia).
R. M. Phatarfod.
Journal of Hydrology, Vol. 30, No. 3, p 199-217, July 1976. 5 tab, 18 ref.

Descriptors: *Stochastic processes, *Reservoirs, *Mathematical models, *Simulation analysis, Draft-storage curves, Probability, Inflow, Statistical models, Statistics.
Identifiers: *Stochastic reservoir theory, Draft relationship, Simulation techniques, Gamma Markov sequences, Random-walk techniques, Reservoir size, Inflow distribution, Constant draft ratio.

The problem of the reservoir size-reliability-draft relationship is examined. It compared the mathematician's analytical efforts with the simulation techniques of the engineers and hydrologists and suggested that the two methods should complement each other. The various models for generating gamma Markov sequences were looked at, and a new model which was analytically more suitable to the problem in question was suggested. An alternative to the traditional formulation of the problem in terms of probability of failure was suggested, and a method based on random-walk techniques was employed to give close approximations. The effects of various parameters of the in-

flow distribution on the reservoir size to give the same reliability for a constant draft ratio were discussed. (Roberts - ISWS)

Identifiers: *Reservoir operating policy, Routing models, *Wabash River systems model.

A daily simulation model is presented for the Upper Wabash River and Reservoir System in Indiana. The motivation for this work was to apply systems approaches to surface water planning and management facets for a major river in the state of Indiana. The core of the project was the building of river-reservoir simulation software including reservoir operating policy rules and to do so for a 24 hour time step. The construction of the simulation model, the different operating policies used, a discussion of benefit estimation, and the software documentation have been detailed in five previous reports. (See also W74-12197; W74-12196; W73-07815; W73-04628 and W72-13301) This report contains a brief summary of the materials found in the earlier publications; however its major purpose is to record some over-all conclusions. Presented are views for future research and the benefits that may be derived from this work. Additional work on programs, particularly on data base organization, access, editing and documentation, is given.

SHADOW LENGTH TABLES FOR ENVIRONMENTAL PLANNING,
Forest Service (USDA), Berkeley, Calif. Pacific Southwest Forest and Range Experiment Station.
H. G. Halverson, and J. L. Smith.
Report PSW-102, 1974. 6 p, 2 tab.

Descriptors: Snow management, Planning, Solar radiation, Water management(Applied), Heat, Light, Insolation, Reproduction, *Forest management, Light intensity.
Identifiers: Shadow length tables, Solar light, Solar heat.

Presented are the rationale for using shadows in environmental control; calculation techniques for specific latitudes, dates, aspects and slopes; instructions on using shadow length in planning; and examples of the application of the tables to snowmelt management. Separately, eight sets of tables are available for latitudes 36 degrees north to 50 degrees north in increments of 2 degrees. Each set covers one latitude, 25 aspects, and seven dates during the year. Aspect refers to a dual-angle method of description that includes both slope and aspect. Dates range from December 22, the shortest day of the year, to June 22, the longest. (Forest Service)

CONTROLLING SOLAR LIGHT AND HEAT IN A FOREST BY MANAGING SHADOW SOURCES,
Forest Service (USDA), Berkeley, Calif. Pacific Southwest Forest and Range Experiment Station.
Halverson, G. Howard, and James L. Smith.
USDA Forest Service Research Paper PSW-102, 1974. 14 p, 5 fig, 7 ref.

Descriptors: *Forest management, Light, Heat, Insolation, Data collections, Plant growth, Reproduction, *Light intensity, *Solar radiation, Snow management, Planning.
Identifiers: *Solar light, *Solar heat, Shadows, Sunlight.

Control of solar light and heat to develop the proper growth environment is a desirable goal in forest management. The amount of sunlight and heat reaching the surface is affected by shadows cast by nearby objects, including trees. In timbered areas, the type of forest management practiced can help develop desired microclimates. The results depend on the size and orientation of openings created and on the shade cast by surrounding vegetation. A computerized method to calculate the extent of boundary shading for any combination of date, slope, and aspect between 23.45 degrees N. latitude and 50 degrees N. latitude is described. Shadow-length tables provide coverage for the contiguous United States in increments of 2 degrees from 36 degrees N latitude to 50 degrees N latitude. By extrapolation, the tables can be used from the Mexican to the Canadian border. (Forest Service)

SURFACE WATER AVAILABILITY, PICKENS COUNTY, ALABAMA,
Geological Survey, Tuscaloosa, Ala.
M. E. Davis, and A. L. Knight.
Alabama Geological Survey, University, Map 126, 1972. 9 p, 3 fig, 1 map, 1 tab, 11 ref.

Descriptors: *Surface water availability, *Streamflow, *Water yield, *Water quality, Chemical analysis, Runoff, Average flow, Low flow, Hydrologic data, Maps.
Identifiers: Pickens County(Ala).

The average annual runoff originating in Pickens County, Alabama, is about 18 inches or 0.84 million gallons per day (mgd) per square mile. The Tombigbee and Sipsey Rivers, where they join, have average flows of about 5,600 mgd and 700 mgd, respectively, and median annual 7-day low flows in excess of 350 mgd and 45 mgd, respectively. Lubbub, Bear, and Coal Fire Creeks have average flows that exceed 100 mgd at their mouths and median annual 7-day low flows of 9 mgd or greater in their lower reaches. The dissolved-solids content of surface water (estimated from specific conductance values) is less than 50 mg/liter except in the Tombigbee River where the dissolved-solids content generally is less than 75 mg/liter. The water is soft and the chloride content generally is less than 10 mg/liter. (Woodard-USGS)

WATER AVAILABILITY OF MONROE COUNTY, ALABAMA,
Geological Survey, Tuscaloosa, Ala.
J. C. Scott, M. E. Davis, J. F. McCain, and H. M. Whitman.
Alabama Geological Survey, University, Map 132, 1972. 30 p, 5 fig, 2 maps, 5 tab, 16 ref.

Descriptors: *Water resources, *Available water, *Surface waters, *Groundwater, *Water quality, Water supply, Water utilization, Water yield, Streamflow, Flow rates, Aquifer characteristics, Hydrologic budget, Maps.
Identifiers: Monroe County(Ala).

The principal sources of ground water presently being utilized in Monroe County, Alabama, are the Nanafalia aquifer in the northern and central parts of the county and the Miocene-Pliocene aquifer in the southern part. These aquifers are capable of yielding from 0.2 to 1.0 million gallons per day (mgd) or more per well. Potential sources of ground water not presently being utilized are the Ripley aquifer in the northeastern part of the county and the Eocene-Oligocene aquifer in the southern part. These aquifers are capable of yielding as much as 1.0 mgd per well. An average of about 315 mgd of water is recharged to groundwater reservoirs in the county annually. The Alabama River, the largest source of surface water, has an average flow of about 20,500 mgd and a 7-day low flow of about 5,750 mgd at Claiborne. The Little River and Big Escambia, Lovetts, Randons, Limestone, and Big Flat Creeks are also potential sources of large quantities of water. These streams have average flowsin excess of 50 mgd and 7-day low flows in excess of 2 mgd in their lower reaches. Average runoff into streams in the county is about 0.95 mgd per square mile of drainage area. Ground water generally is soft but the dissolved-solids content exceeds 1,000 mg/liter in some parts of the county, and locally the iron content exceeds 0.3 mg/liter. Surface water is soft and generally contains less than 100 mg/liter dissolved solids. Water use in 1967 in Monroe County was about 2.8 mgd, which is less than 1 percent of the total water available. (Woodard-USGS)

GEOLOGY AND WATER RESOURCES OF BROWN COUNTY, SOUTH DAKOTA--PART II: WATER RESOURCES,
Geological Survey, Huron, S. Dak.
N. C. Koch, and W. Bradford.
South Dakota Geological Survey, Vermillion, Bulletin 25, 1976. 53 p, 29 fig, 6 tab, 24 ref, append.

Descriptors: *Water resources, *Water quality, *Aquifer characteristics, *Surface waters, *South Dakota, Water wells, Water yield, Water utilization, Water level fluctuations, Streamflow, Flow rates, Floods, Groundwater recharge, Chemical analysis, Water analysis, Hydrogeology.
Identifiers: Brown County(S Dak).

Brown County, an agricultural County in northeastern South Dakota, has an area of 1,683 sq mi. Glacial outwash is an important water-bearing deposit in Brown County. Such deposits contain three major aquifers, the Deep James, Middle James, and Elm. Where 40 ft or more thick, these aquifers can provide yields of 500 gpm or more. The quality of water from aquifers above the bedrock surface varies from good to very poor for irrigation use. Recharge to these glacial drift aquifers is by infiltration and percolation of snowmelt and precipitation through overlying materials and by subsurface inflow from Spink and Marshall Counties. The major bedrock aquifers thus far developed are in the Dakota, Fall River, and Sundance Formations. Wells tapping these aquifers are from 850 to 1,450 ft deep. Water from the Sundance aquifer recharges the Fall River aquifer which in turn recharges the Dakota aquifer. The chemical quality of water from the Dakota, Fall River, and Sundance aquifers varies from fair to poor. Most streamflow, and any flooding, in Brown County occurs in the spring and early summer from snowmelt and precipitation. Except for the Elm River, most streams commonly have no flow in the late summer, fall, and winter. The James River between Columbia and Stratford loses water at an average rate of 3,000 acre-ft per year by evaporation. During major flooding from 1950 to 1970 five periods of major stream loss occurred, ranging from 16,000 to 40,000 acre-ft. The dissolved solids concentration of water from streams during periods of high flow may be less than 300 mg/liter, but during periods of low flow it may be more than 2,000 mg/liter. (Woodard-USGS)

Descriptors: Water distribution(Applied), *Hurricanes, *Surges, *Land use, Tidal waters, Tidal effects, Gulf of Mexico, *Mississippi, Coasts, Gulf Coastal Plain, Water demand, Water quality.
Identifiers: *Hurricane Camille(1969), Water resources reallocation, *Tidal surges.

The purpose was to assess the impact of the tidal surge of Hurricane Camille on the land use changes on the Gulf Coast of Mississippi and to determine the water resources reallocations. Single-family residences least likely to regenerate in the coastal part of the surge zone, but residential property was the fastest growing land use further inland in the surge zone. Land use for commercial establishments, which are transportation oriented, was most likely in the most storm-prone part of the surge zone. Increasing population densities in the surge zone and the growth of industry were major factors increasing the water demand and contributing to deteriorating water quality.

American Journal of Agricultural Economics, Vol. 58, No. 3, p 403-414, August 1976. 1 fig, 3 tab, 34 ref.

Descriptors: *Resources development, Economics, *Simulation analysis, Evaluation, *Regional analysis, Drainage, Water, Land clearing, Income distribution, Effects, Governments, Mathematical models, Equations, Systems analysis, *Canada.
Identifiers: Development programs, *Interlake Area(Manitoba).

The usefulness of a dynamic regional economic model for evaluating resource development programs is described and demonstrated. The model results indicate that without development programs, land may constrain livestock production after 1976. The growth in crop production is demand determined and will not exceed available land. A labor requirement of 15,400 man-years is projected for 1976 with 2,600 unutilized. Output and income distribution effects of drainage, training, and land-clearing development programs are assessed for the Interlake Area of Manitoba. (Bell-Cornell)

Journal of the Irrigation and Drainage Division, Proceedings of the American Society of Civil Engineers, Vol 102, No IR3, p 295-305, September 1976. 3 tab, 1 fig, 11 ref.

Descriptors: *Aqueducts, *Irrigation, *Optimization, *Mathematical models, Design, Planning, Water allocation(Policy), Dynamic programming, Constraints, Methodology, Equations, Systems analysis.
Identifiers: Benefit maximization, Demand functions, Computer programs, Design capacity.

A methodology is presented for determining th proper allocation of water to the various co sumers along an aqueduct under varying dema conditions such that the net benefit obtained maximum. With these allocations, the aqueduc capacity required between diversions is dete mined. The methods are highly suitable for o timum analysis in development planning situ tions. Two deterministic analytical models usi dynamic programming are presented. The fi model considers the problem with simultaneous peaking demand functions; the second mod removes this constraint from the demand fun tions. The results provide the optimum sizes of t aqueduct reaches for a given quantity of availab water. (Bell-Cornell)

Identifiers: *Tisza River basin(Hungary), *Uti function, *Multiple objectives, Scaling factors.

Choosing among several development plans the water resources of the Tisza River in Hung is a complex problem, due to the multiple conf ing objectives, i.e., economic, environmental, cial and technical considerations. This paper vestigates the usefulness of multiattribute uti theory for evaluating alternative plans for w resources development in the Tisza basin. result, which requires an explicit consideratio the tradeoffs among attributes, is a card evaluation of the alternatives. This indicates much better one alternative is than another as as permits a sensitivity analysis of the tradeo Also, the model is appropriate for explicitly cluding in a rigorous manner the uncertaintie the problem in the formal analysis. Five poss planning alternatives are described; next, tw attributes that measure the degree to which planning objectives are met are defined. A ut function over the twelve attributes is assessed preliminary results indicate that building i basin water transfers from the Danube or f small reservoirs in the northeast is to be prefe to developing the other three alternatives sidered. rs: *Operating rules, *Economic produc- tions, Marginal values.

mine the optimal dimensions of a develop- ject, one relies on a cost-benefit analysis. ating the economic benefits one may ex- erive for a development project, one is to tent dependent on the operating rules adopted for the scheme. It is important, therefore, to consider the 'optimal operational strategy' problem from the very start of the feasibility study. To define an optimal operating policy for a multi-purpose development scheme and calculate the mathematical expectanctany of the annual gain hoped for, the storage can be considered as a stock of raw material (water) which yields a short-term economic benefit and which competes with the long-term benefit to be derived from storage designed to meet requirements in future months. In comparing the respective advantages associated with the water supply and storage level, monetary values in the form of economic production functions are taken as the reference. This article considers economic production functions in the determination of marginal storage values, operating rules and average annual operating gain for a multi-purpose dam. The Decision-Hazard type problem to be solved utilizes dynamic programming to find the optimum operating strategy. (See also W76-12535) (Bell-Cornell)

DYNAMIC PROGRAMMING FOR DETERMINATION OF A STORM WATER OUTLET SYSTEM OF PIPES AND FLOOD-DAMPING DAMS,
Societe Grenobloise d'Etude et d' Applications Hydrauliques (France).
M. L. Darnige.
In: The Use of Computer Techniques and Automation for Water Resources Systems, Washington, D. C., 1974, Volume II, p 27-29.

Descriptors: *Water resources development, *Dynamic programming, *Storm water, *Outlets, Pipes, Dams, Flood control, Hydrographs, Storage, Discharge(Water), Opitimization, Metholodology, Upstream, Algorithms, Systems analysis.
Identifiers: *Cost minimization.

This short article considers finding the optimalcost and operation of an arterial catchment area outflow network. The first computation phase ends at the final point downstream, for which the upstream discharge index corresponding to minimal total cost is determined. In the second phase, the required development design discharge for each section and the associated storage capacities at each site are established from the index, working up the arterial system. In considereing the validity of the optimization method, it is commented that the method should be classed as heuristic, providing a solution of 'theoretically non-proven optimality,' which at best be taken only as optimal or near-optimal. A QUANTITATIVE MODEL FOR THE PLANNING OF SURFACE WATER RESOURCES: USE OF MIXED VARIABLE LINEAR PROGRAMMING,
Ardour-Garonne Agency, Toulouse (France), Programming Group.
D. Bortolet, R. Lohou, and D. Monges.
In: The use of Computer Techniques and Automation for Water Resources Systems, Washington, D.C., 1974, Vol. II, p 43-48. 4 fig.

Descriptors: *Water resources, *Planning, *Surface waters, *Linear programming, *River basins, Computers, *Computer programs, Algorithms, Reservoirs, Demand, Storage, Construction, Scheduling, Constraints, Mathematical models, Systems analysis.

Presented is a linear programming model for dealing with the problem of keeping a minimum acceptable flow in a river basin in spite of irrigation. The actual problem to solve is the scheduling of the construction of reservoirs to satisfy irrigation demand with a given guarantee without river flows falling under the minimum acceptable flow and with a view to keeping the updated cost of the computer program to a minimum. In the methodology, first a demand and an offer curve are derived. Then, to linearize the program, the curves are cut into segments giving the cost function of capacity. A double micro-decomposed structure is derived which is used largely to minimize the occupied computer's store. The Branch and Bound algorithm is used to solve the mathematical programming problem. Identifiers: Catchments.

Since the introduction of computers, river forecast offices have initiated methods to automate data collection and processing, forecast preparation, and the distribution of warnings and forecasts. A goal has been set to develop forecast procedures which maximize the usefulness of modern data acquisition and processing techniques and incorporate the use of a conceptual hydrological simulation model. Computer programs and techniques cover all phases of development, including the acquisitation , processing of basic data, the calibration of model parameters, and operational forecasting procedures. This article discusses basic data acquisition and processing, a conceptual catchment model, parameter optimization, future additions, field application, and program availability. In: The Use of Computer Techniques and Automation for Water Resources Systems, Washington, D.C., April 1974, Vol. II, p 95-99.

Descriptors: Water resources, *Planning, *Colorado River, *Simulation analysis, *Salinity, Routing, Hydrology, River basins, Computers, Mathematical models, Systems analysis.

In the Colorado River, additional water utilization features are being constructed which will allow the total flow of the river to be diverted for usage. The increasing diversions and consumptive uses are increasing the natural salinity levels. To analyze this problem and to assist in planning salinity alleviation measures, a basin simulation model has been developed. This article discusses the model in terms of general capability and operation, relationships with basin features, hydrological relationships, and salinity routing. This approach allows the operator to interact with the system and utilize his experience and intuition, thereby solving efficiently complex problems pertaining to river basins. MATHEMATICAL SIMULATION AND OPTIMIZATION OF FLOOD CONTROL SYSTEMS,
Belorusskii Central Research Inst. for Water Resources, Minsk.
V. A. Khavitch.
In: The Use of Computer Techniques and Automation for Water Resources Systems, Washington, D.C. April 1974, Vol. II, p 126-129. 1 tab, 6 ref.

Descriptors: *Flood control, *Optimization, *Simulation analysis, Chezy equation, Constraints, Unsteady flow, Decision making, Design, Computers, Mathematical models, Systems analysis.
Identifiers: Cost minimization.

Flood control necessitates development of efficient systems which can provide preventive or operational control. Providing a passive protection from high waters, the former involve measures for building dikes and increasing the channel capacity, or both. The latter have an effect on active flood control and include regulating reservoirs to be filled and emptied depending on the flood flow. This paper discusses problems of applying mathematical simulation methods to optimization of a preventive control system which comprises a regulated channel and dike structures. The optimization procedures serve to determine system structure parameters which minimize annual total costs. In this case, it is appropriate to apply a scanning method which makes provisions for a simple algorithm and a possibility to find a global extreme irrespective of the function type. Model tests show that the optimal decisions may result not from combined channel improvement and dike construction only, but can involve one of these separate measures. SIMULATION MODEL OF THE QUANTITATIVE AND QUALITATIVE EVOLUTION OF WATER RESOURCES AT DIFFERENT POINTS OF A RIVER-BASIN (ORNE),
Financial Agency of the Basin 'Seine-Normandie', Paris(France). Water Resources Div.
M. Dargent, and F. Biesel.
In: The Use of Computer Techniques and Automation for Water Resources Systems, Washington, D.C., April 1974, Vol. II, p 129-132.

Descriptors: *Simulation analysis, Water resources, *River basins, *Hydrologic aspects, Management, Forecasting, Computers, Data collections, Meteorology, Economics, Mathematical models.

The hydrological evolution of a large basin is of great physical complexity. The decision maker needs a simulation model which allows him to forecast physical consequences. This article discusses the need for such a management model and for preliminary studies necessary for the quantitative econometric exploitation of the model. The model capable of effecting the needed forecasts with sufficient precision should represent the essential elements of the hydrological cycle--the principal runoff lines of surface water, the flow laws of underground water tables, climatological phenomena, human consumption, discharges, pollution, and so on. The correct resolution of three categories of problems is essential to a quantitative econometric use of the model: (1) mathematical and computer aspects raise technical difficulties now under control; (2) the collection of natural data can be long and costly if one begins with nothing but poses no new technical problem; and (3) the probability quantification of climatic calendars used by the model raised a problem for statistical meteorology in a new way and necessitates studies of particular difficulty. The principal difficulty is not to be found in the new techniques, but in the determination of the conditions of regulation and use of the model. (See also W76-12535) (Bell-Cornell)

THE 'POLPOLE' MODEL: AN ATTEMPT TO ANALYSE THE WATER SYSTEM IN THE FINANCIAL AGENCY OF A FRENCH RIVER BASIN,
Financial Agency of the Basin 'Seine-Normandie', Paris (France).
P. F. Teniere-Buchot.
In: The Use of Computer Techniques and Automation for Water Resources System, Washington, D. C., April 1974, Vol. II, p 133-136.

Descriptors: *River basins, *Long-term planning, *Water resources development, *Water supply, *Water pollution control, Computers, Mathematical models, Simulation analysis, Operations research, Graphical methods, Forecasting.
Identifiers: *Seine-Normandie Basin(France).

Described is France's unique organization of Financial Agents of the Basin, administering the national inheritance in terms of resources and safeguarding quality. Royalties are paid by consumers and refunded to them in the form of subsidies designed to facilitate water resources development and water pollution control. Discussed is an analysis of the Seine-Normandie hydro-geographical Basin to facilitate the choice of long-term objectives by systematically investigating the various potential outcomes regarding water supplies and the increase or decrease in water pollution. The method used is the provisional structural analysis, an overall approach employing matricial procedures, the theory of graphs, and operational research. It is developed in seven phases: (1) inventory of the variables making up the system; (2) creation of a register of logical relations existing between variables; (3) creation of a basic relations register; (4) synthesis of decisional actions and planning; (5) creation of a system associated graph; (6) quantization of the graph; and (7) computer processing. Limited to a single objective, 'progress of pollution,' the Popole model analyses the yearly changes in some fifteen variables. (See also W76-12535) (Bell-Cornell)

CONSTRUCTION AND UTILIZATION OF COMPLEX MATHEMATICAL MODELS IN THE PLANNING OF THE OPTIMAL DEVELOPMENT OF LARGE HYDROGRAPHIC SYSTEMS AND RIVER BASINS,
Ecole Nationle Superieure des Mines de Paris, Fontainebleau(France) Center for Geological Information.
Y. Emsellem, P. Ramain, A. Dreyfus, and P. Hubert.
In: The Use of Computer Techniques and Automation for Water Resources Systems, Washington, D.C., April 1974, Vol. II, p 177-180.

Descriptors: *Water resources development, *River basins, *Planning, Hydraulics, Optimization, Regional analysis, Forecasting, Simulation analysis, Costs, Mathematical models, Systems analysis.

Water is used to satisfy the needs of a set of groups and activities. Based on these needs, the necessary hydraulic projects are estimated and their finances calculated; financial transfers between activities and between groups are analyzed. On the basis of each possible objective set, a synthetic file is built; the comparison between synthetic files is used to clarify the choices. Optimization is difficult on a big scale; at the level of large basins, there is no optimal objective solution: there exists only one solution which is the best from a subjective viewpoint. A set of models and related operations built by the Delegation for Technical and Scientific Research are examined herein. Included are: regional segmentation; development plans; regional description; typology of the users, forecast model; hydraulic systems typology; simulation model; cost repartition model; and transfer analysis. FLOOD HAZARD ANALYSES FOR LOWER MARSH CREEK (INCLUDING SELECTED TRIBUTARIES), BANNOCK COUNTY, IDAHO
Soil Conservation Service, Boise, Idaho.
Prepared for Bannock County, Idaho Department of Water Resources, Southeast Idaho Council of Governments, Portneuf Soil and Water Conservation District. July 1975. 28 p, 6 fig, 15 plates, 7 tab

Descriptors: *Floods, *Flood profiles, *Idaho, Floodwater, *Streamflow forecasting, Flood forecasting, Peak discharge, Non-structural alternatives, Zoning, Control structures, Flood plains, Ice jams.
Identifiers: *Marsh Creek(ID), Goodenough Creek(ID), Walker Creek(ID), Birch Creek(ID), Dry CAnyon(ID), Bannock County(ID), Cottonwood Creek(ID), Bell Marsh Creek(ID), Downey(ID), Arimo(ID), 500 year flood, 100 year flood.

Flood plains in the study area are used primarily for agriculture, though there is some residential development which is expected to increase. Population within incorporated areas of Bannock County is about 900. Marsh Creek watershed is about 400 square miles of mountainous terrain. The gradient of Marsh Creek, a tributary of Portneuf River, is about 4.5 feet per mile and the creek has numerous small tributaries. Floods occur in winter and early spring when there is generally a moderate volume of water, the runoff lasts 5 to 7 days and debris and ice are carried by water to plug bridges and culverts. Floods also occur in late spring and summer after thunderstorms. These are generally of short duration with a small volume of runoff. Since 1911, 21 floods of note have occurred. The largest was in 1962. Future floods are predicted through the use of regression analysis to correlate watershed data with data from similar watersheds. For Marsh Creek the following peak flows are predicted for each recurrence interval: 500 year, 2,340 cubic feet per second; 100 year, 1,450 cfs; 50 year, 1,170 cfs; and 10 year, 630 cfs. For Dry Canyon the following figures were computed: 500 year, 4,730 cfs; 100 year, 1,610 cfs; 50 year, 890 cfs; and 10 year, 220 cfs. Along Marsh Creek the areas flooded will vary from 1030 ac

,4890 acres depending on the predicted flow. cific recommendations are made on flood plain Agriculture ctan continue to use flood plains, e industrial, commercial and residential uses ld be restricted and buildings should be flood fed. A combination of zoning codes and other lations can be used to accomplish this. Struc- means may be used in some locations. (Smith th Carolina)

ers: East Branch Nimishillen Creek(OH), unty(OH), 100 year flood, 25 year flood, rface profiles.

unty is characterized by a land use and ic base that is mainly agricultural. Project- nt development rates, by 1990 12% of the a will consist of single family dwellings.) population was 372,000, a 9.4% increase 0. Some areas in the cities of Canton and le are urbanizing rapidly. Gently rolling e contrasts with deep glacial valleys there erable evidence of glacial till composed of t, clay, and larger rocks. East Branch len Creek drops from 6 to 15 feet per mile a drainage area of 41.4 square miles.

Nearly all major floods are produced by winter and spring rains falling on saturated soil which is snow covered or frozen. The largest flood was in 1913, but damages are not known. Future flooding was predicted in this report by surveying the land and making a mathematical model of the watershed. Water surface profiles were computed for 25,50 and 100 year present condition flood and the 100 year future condition flood. Some of the 7 railroad and 23 highway bridges spanning the creek restrict flow. The 100 year event would cover 1,262 acres including 89 houses and 68 commercial buildings. A peak discharge of 8,047 cubic feet per second, along with water velocities up to 6.12 feet second are predicted. (Smith - North Carolina)

FLOOD HAZARD INFORMATION: BACKLICK CREEK, VIOLET TOWNSHIP, FAIRFIELD COUNTY, OHIO.
Army Engineer District, Huntington, W. Va.
Prepared for the Ohio Department of Natural Resources, Columbus, and Violet Township, Ohio, 3 p, 1 fig, 2 plates. November 1972.

Descriptors: *Floods, *Flood profiles, *Flood plains, *Ohio, Zoning, *Flood plain zoning.
Identifiers: *Blacklick Creek(OH), Violet Township(OH), Big Walnut Creek(OH), Intermediate Regional Flood.

Magnitude and frequency of flooding along a 2.7 mile reach of Blacklick Creek, a tributary of Big Walnut Creek, are described. With an average slope of 9.6 ft per mile, the stream flows through a well-defined, heavily tree lined channel which averages 88 feet wide. The flood plains are rural and undeveloped, averaging 850 feet in width. Obstructions to flood flows include 4 bridges and natural vegetation. Although flood damages would be limited to crops and road crossings, these could be minimized by application of the flood plain ordinance for which the data herein have been developed. With a streambed elevation of 778.8 feet (mean sea level datum) the Intermediate Regional Flood would be expected to crest at 791 ft msld at Penn Central RR and Refugee Road and 829 msld at Interstate Route 70 where the approximate streambed is 815 msld. Extent of potential flooding is shown on a topographic map. Information is on file with the Army Corps of Engineers to determine flood plain encroachments on a case by case basis for specific locations. (Salzman-North Carolina)
W76-12592

FLOOD PLAIN INFORMATION: FRESHWATER CREEK, HUMBOLDT COUNTY, CALIFORNIA.
Army Engineer District, San Francisco, Calif.
Prepared for Humboldt County, Calif., October 1975. 15 p, 5 fig, 9 plates, 4 tab.

Descriptors: *Flash floods, Floods, *Tidal waters, *Peak discharge, *Flood protection, *Non-structural alternatives, *California, Flood flow, Flood stages, Flow characteristics, Flood plain zoning, Planning.
Identifiers: *Freshwater Creek(CA), Humboldt County(CA), Intermediate Regional Flood, Standard Project Flood.

Freshwater Creek lies in a small coastal mountain basin draining 34 square miles above its confluence with Ryan Slough. Primarily rural with some unincorporated urban development, the flood plains are subject to increasing development, with areas best suited for future urbanization lying along the eastern edge of the City of Eureka, the county seat. In its upper basin the stream slopes at 315 feet per mile, yet averages only 34 ft/mi in the lower basin. Flood season extends from October to April resulting from heavy rains. Floods rise to extreme flood peaks in a short period of time with high velocities in the main stream channels. High tide on Arcata Bay and a flood stage in Freshwater Creek presents an extremely hazardous condition. No flood control works exist; however, implementation of flood plain ordinances and regulations are underway. Because no gaging stations exist, no flood records have been kept except for news reports which indicate that the floods of 1955 and 1965 inundated developed properties. An Intermediate Regional Flood would have an estimated peak discharge of 10,000 cubic feet per second at Freshwater Corners with channel velocities of 4 to 6 ft/sec in the lower reaches, 1 to 3 ft/sec overbank. About 4,000 acres would be flooded by an IRF. A Standard Project Flood would have an estimated peak discharge of 13,800 cfs at Freshwater Corners with slightly higher channel and overbank velocities. (Salzman-North Carolina)
W76-12593

FLOOD PLAIN INFORMATION: YELLOW RIVER, PART III, METROPOLITAN ATLANTA, GEORGIA.
Army Engineer District, Savannah, Ga.
Prepared for Atlanta Regional Commission, Georgia, June 1973. 32 p, 14 fig, 37 plates, 6 tab.

Descriptors: *Floods, *Flood profiles, *Flood plains, *Storms, Flow characteristics, *Peak discharge, *Georgia, Flood damage, Warning systems, Nonstructural alternatives, Historic floods, Flood data, Flood frequency, Obstructions to flow.
Identifiers: *Yellow River(GA), Pew Creek(GA), Redland Creek(GA), Little Sewanee Creek(GA), *Atlanta(GA), Lawrenceville(GA), Intermediate Regional Flood, Standard Project Flood.

This report presents flood information on a 14.5 mile reach of Yellow River, a 2 mile reach of Pew Creek, a 2 mile reach of Redland Creek and a 3.5 mile reach of Little Sewanee Creek. Located northeast of Atlanta, these streams drain 46.3 square miles above the study area and are characterized by narrow flood plains and slopes ranging from 7 to 45 feet per mile. There are no developments in the narrow flood plain of the Yellow River which are subject to flooding. Existing development in the flood plains is limited to the upper reaches of Redland Creek in the City of Lawrenceville. Expansion of the Atlanta area is expected to bring the flood plains under development pressure in the near future. Vegetation, bridges and culverts in the study area can obstruct floodflows. Flooding can occur in any season and can result from thunderstorms, tropical depressions, and general rainstorms. Five damaging floods have occurred since 1919. Peak discharge during the February 1961 flood reached 9,080 cubic feet per second on the Yellow River as 11.54 inches of rain fell. The Intermediate Regional and Standard Project Floods would have peak discharges of 6,230 and 15,580 cfs, respectively. IRF would flood 1,120 acres and 11 buildings, would rise 15 feet in 24 hours and remain above bankfull 36 hours. Channel velocities during an IRF would be 3-12 ft/sec with overbank velocities 2-3 ft/sec. The SPF would inundate 2,660 acres and 39 buildings and would rise 22 feet in 36 hours and remain above bankfull for 60 hours. In the Atlanta area only Gwinett County has flood plain regulations. DIGITAL MODEL TO PREDICT EFFECTS OF PUMPING FROM THE ARIKAREE AQUIFER IN THE DWYER AREA, SOUTHEASTERN WYOMING,
Geological Survey, Cheyenne, Wyo.
G. C. Lines.
Water-Resources Investigations 8-76 (open-file report), February 1976. 24 p, 14 fig, 1 tab, 12 ref.

Descriptors: *Model studies, *Groundwater resources, *Projections, *Wyoming, *Computer models, Aquifer characteristics, Potentiometric level, Water levels, Leakage, Pumping, Water utilization, Hydrogeology, Forecasting, Maps, Simulation analysis, Drawdown.
Identifiers: Southeastern Wyoming.

A digital computer model was developed and used to simulate an unconfined sandstone aquifer (Arikaree aquifer) in about 340 square miles in southeastern Wyoming. The model was calibrated by comparing observed and calculated changes in the potentiometric surface and leakage from the aquifer along streams during water year 1974. The comparison was fairly good for changes in the potentiometric surface and was good for leakage. The calibrated model was used to predict changes in the potentiometric surface and leakage through water year 1979, assuming no new ground-water development after 1974 and 6.5 percent of the normal precipitation as recharge to the aquifer. Water-level declines of as much as 14 feet (4.3 meters) were predicted, but much of the area would be relatively unaffected. The total predicted decrease in leakage between water years 1974 and 1979 was about 500 acre-feet per year; the greatest decrease was predicted along streams closest to areas of pumpage. PRELIMINARY ANALYSIS OF GEOHYDROLOGIC DATA FROM TEST WELLS DRILLED NEAR CHALK POINT, PRINCE GEORGES COUNTY, MARYLAND,
Geological Survey, Parkville, Md.
F. K. Mack.
Open-file report 76-322, 1976. 31 p, 12 fig, 5 tab.

Descriptors: *Groundwater resources, *Water quality, *Water demand, *Urbanization, *Aquifer characteristics, Data collection, Water yield, Pumping, Water level fluctuations, Hydrogeology, Transmissivity, Projections, Water supply.
Identifiers: *Prince Georges County(Maryland), *Chalk Point(Maryland).

Continued growth of southern Maryland will entail demands for increases in ground-water withdrawals. Part of the process of evaluating ground-water resources in the Chalk Point area is the establishment of the relationship between quantities of water pumped from individual aquifers and the resulting effect on water levels in outlying areas. A test hole was drilled to 1,100 ft at a site several thousand feet north of the high-yielding wells. Utilizing data from the probe hole to determine screen positions, three observation wells were constructed at the site to provide separate wells in the Patapsco, Magothy, and Aquia aquifers. The water level in each of these monitoring wells is affected by barometric pressure and tidal changes in the nearby Patuxent River. The transmissivities of the sand in the Patapsco Formation screened from 832 to 842 ft below sea level; the Magothy aquifer and the Aquia Formation, as determined by water-level recovery tests, are 570 sq ft/day, 730 sq ft/day, and 1,176 sq ft/day, respectively. RECENT ADVANCES IN ARTIFICIA RECHARGE,
Geological Survey, Austin, Tex.
D. C. Signor.
Paper presented at Proceedings of the Conferen of the Great Plains Resources Council, Denv Colorado, April 8-9, 1976. 17 p, 13 ref.

Descriptors: *Artificial recharge, *Aquifers, * recharge, *Infection wells, *Water spreadi Methodology, Water quality, Sediments, Che cal properties, Water treatment, Anaerobic b teria, Hydraulic conductivity, Infiltration rates.

This paper is concerned with the techniques of tificial recharge and the problems that confr their utilization. The approaches to solving th problems constitute the recent advances in art cial recharge. Two recharge techniques are co monly used: (1) Spreading basins, in which wa that is concentrated on the surface percola through overlying materials to the formation; (2) injection wells or shafts, in which there i direct connection from the surface to the for tion. Suspended sediment in the water that is to recharged by spreading is a serious problem. T sediment settles and is filtered out of the wate the basin surface and restricts subsequent infil tion as the surface becomes sealed by the fi grained materials. Recent work on this prob has been directed toward developing surface c ditions that minimize the sealing effect and tow removing sediment from the input water by che cal treatment. Recharge through injection w usually requires stringent water-quality conside tions, and recharge operations are generally successful than in spreading basins beca suspended sediment in the recharge water cl the formation near the well. Once the formatio clogged, it is difficult to remove enough sedim to completely rejuvenate the well. The prob can be avoided only if clear water is used recharge. (Woodard-USGS)

DEVELOPING A STATE WATER PL GROUND-WATER CONDITIONS IN UT SPRING OF 1976,
Geological Survey, Salt Lake City, Utah.
C. T. Sumsion.
Utah Division of Water Resources, Salt L City, Cooperative Investigations Report No 1976. 69 p, 40 fig, 2 tab, 15 ref.

Descriptors: *Groundwater resour *Withdrawal, *Water level fluctuations, *U *Data collections, Hydrologic data, Aqu characteristics, Water wells, Groundwater ba Water utilization, Irrigation, Hydrographs, Ma

This is the thirteenth report in an annual series describe ground-water conditions in Utah. Rep in the series are prepared cooperatively by U.S. Geological Survey and the Utah Divisio Water Resources, and contain information on construction, ground-water withdrawals, w level changes, and related changes in precipit and streamflow. Supplementary data such graphs showing chemical quality of water maps showing water-table configuration ar cluded in reports of this series only for those or areas for which applicable data are avai and are important to a discussion of char

LIBRARY U. OF I. URBANA-CHAMPAIGN

d-water conditions. This report includes in-
ıal discussions of selected major areas of
d-water withdrawal in the State for the
lar year 1975. Water-level fluctuations, how-
are described for the period spring 1975 to
1976. The estimated total withdrawal of
from wells in Utah in 1975 was about
0 acre-ft, which is about 80,000 acre-ft less
n 1974, but 90,000 acre-ft greater than the
ge annual withdrawal during 1965-74. Both
crease from 1974 and the increase over the
r average were due primarily to changes in
awals for irrigation. (Woodard-USGS)

WATER SUPPLIES FROM ULSTER VALLEY GRAVELS,
Institute of Geological Sciences, London (England). Dept. of Hydrogeology.
M. Price, and S. S. D. Foster.
The Institution of Civil Engineers, Proceedings, Part 2, Research and Theory, Vol 57, p 451-492, September 1974. 6 fig, 1 tab, 19 ref.

Descriptors: Water resources, *Water supply development, Geologic investigations, *Hydrologic aspects, *Groundwater, Evaluation, Storage, Recharge, Water demand, Industrial water, Economics, Pumping, Rivers, *Gravels.
Identifiers: *Valley gravels, *Ulster(United Kingdom).

Using four examples from Ulster, a discussion is presented of the extent to which techniques of geological exploration and hydrological analysis can be used in the practical evaluation of valley gravels as a water resource. Limitations arise from the geological heterogeneity of these strata and from financial constraints relating to their overall potential, but it is usually possible to make reliable semi-quantitative evaluations of the recharge and storage elements, thus permitting logical water-supply development. Results show that under suitable conditions, valley gravels can be developed to provide low-cost water supplies, particularly where industrial demands of about 10 Ml/day exist. In addition to lower capital and running costs, such schemes have the advantage of utilizing natural storage, albeit limited. (Bell-Cornell)

INTEGRATED MATHEMATICAL MODELS USED FOR GROUNDWATER RESOURCES PLANNING IN AREAS INFLUENCED BY HUMAN SETTLEMENTS,.
Technische Universitaet, Hanover,(West Germany). Institut fuer Wasserwirtschaft, Hydrologie und Landwirtschaftlichen Wasserbau.
G. Battermann, and R. Mull.
In: The Use of Computer Techniques and Automation for Water Resources Systems, Washington, D. C., 1974, Volume II. p 29-32. 6 ref.

Descriptors: *Simulation analysis, Computers, *Groundwater resources, *Planning, Mathematical models, Effects, Evaluation, Parametric hydrology, Systems analysis.
Identifiers: Human interference.

The extension of settlements and industrial areas influence groundwater systems, causing both qualitative and quantitative problems. This article reports on investigations made by Battermann in 1973 to integrate most of these problems in a groundwater model. Hanover, Germany was chosen study area. Discussed are: analog, digital, and hybrid simulation methods used in parallel to investigate the groundwater basin affected; parameter evaluation; and the effects of some interferences, such as marshy ground or wet cellars. The cited examples show the problems connected with the evaluation of groundwater budgets in areas affected by human interference. The different computer technqiues allow a good knowledge to be obtained of the parameters influencing the observed systems. A prediction of the behavior of the system in the future under given circustances can be derived from these simulations. (See also W76-12535) (Bell-Cornell)

OPTIMIZATION OF GROUNDWATER WITHDRAWALS WITH REGARD TO TECHNICAL AND HYDROLOGICAL CONSTRAINTS,
Technische Universitaet, Hanover (West Germany). Institut fuer Wasserwirtschaft, Hydrologie und Landwirtschaftlichen Wasserbau.
H. Hames, and B. Hoffmann.
In: The Use of Computer Techniques and Automation for Water Resources Systems, Washington, D. C., Volume II, p 33-36, 5 ref.

Descriptors: *Groundwater, *Withdrawal, Hydrology, *Optimization, *Constraints, Technology, Water supply, Planning, Hydraulics, Methodlogy, Wells, Pumping, Computers, Equations, Systems analysis.
Identifiers: *Operating plans.

The optimum use and management of available water such as that found in a groundwater reservoir are subject to hydrological and fluid-mechanical restriction; there are also technical constraints caused by size and type of pumping devices. These restrictions and the application of numerical methods require the use of high-speed computers for the prediction of possible water pumpage to aid the engineer in planning. As groundwater will become an increasingly important resource, this paper outlines a methodology for optimizing the use of a groundwater reservoir. The method permits the delivery of operation plans for water-supply devices under the consideration of hydrological and technical--or other--constraints. (See also W76-12535) (Bell-Cornell)

Identifiers: *Mixed-integer programming, Screening, Cost minimization, Interactions.

In planning a water resources system, given a set of feasible water supply projects, a planner might wish to determine which projects could meet future water demands at minimum cost. For screening and sequencing proposed projects, the planner needs an optimization model which explicitly includes surface and ground water interactions in its formulation. This paper describes such a long-range planning model which utilizes mixed-integer programming to minimize the present value of capital and operating costs over a specified planning horizon. A well field may consist of many wells all of which interact with each other and with the stream system. Herein, interactions are expressed in the form of a constraint which limits the amount of water withdrawn from a stream, either directly by diversions and reservoirs or indirectly by ground water pumping, to the quantity of surface water available above that needed to meet downstream flow requirements. The planning model is deterministic. To obtain statistical measures of the performance of a proposed system, subject to variations in streamflow, water demands, etc., the system's operations must be simulated. Discussed is the use of optimization and simulation models and the procedure of aggregation-disaggregation. (See also W76-12535) (Bell-Cornell)

MULTIPURPOSE COMPUTER FOR THE HONOLULU BOARD OF WATER SUPPLY,
Beck (R. W.) and Associates, Seattle, Wash.
S. M. Alexander.
Journal American Water Works Association, Vol. 68, No. 3, p. 147-155. March 1976. 1 fig, 1 plate, 2 ref.

Descriptors: Water resources, *Water management(Applied), *Water supply, *Computer models, *Hawaii, Water, Groundwater, Acquifer management, Networks, Computers.
Identifiers: *Honolulu(HI), *Network analysis.

In order to effectively manage available water resources and operating pumping facilities economically, the Island of Oahu, Hawaii, City and County of Honolulu, has installed an automatic computer control system. The system contains a central processor, core and mass memory to watch over the very complex water supply. Ideally, water is not pumped from acquifer ata rate which exceeds recharge from rain, but at times it has been necessary to surpass this limit. At present the island is divided into 8 primary service areas, but the water board plans to integrate the system and to install booster pumps in some locations to overcome large friction losses in pipes. The control system will supply the requirements of water-system customers within prescribed pressure limits, monitor system operations and alarm detection, manage water resources, utilize available reservoirs to optimum capacity within prescribed constraints, and minimize the cost of pumping. Fixed response control, using a statistical model to predict system requirements, could be used to operate the system, but this must be changed when system parameter change and optimum results will not be obtained. Rather, a dynamic response model has been chosen. This is based on real-time operating analysis of the system through a network analysis model and measuring flows in and out of areas. A great many other accounting and calculating functions are built into the system. Perhaps $20,000 per year will be saved by the system as well as providing improved operation. Descriptors: Water quality, *Grazing, Pinyon pine trees, Juniper trees, Nutrients, Soil moisture, Infiltration, Sediments, *Burning, *Utah, Overland flow, Runoff, Coliforms, *Phosphorus, *Potassium, Pollutant identification.
Identifiers: Southeastern Utah, Pinyon-juniper tree type.

Bacterial analysis (fecal and total coliform) of runoff water from infiltrometer plots indicated that the potential public health hazard of livestock grazing on semiarid open range on gentle slopes is probably minimal. Significantly increased amounts of phosphorus and potassium were measured in overland flow following burning on chained-with-debris-left-in-place sites, but no changes were detected in calcium, sodium, or nitrate-nitrogen contents in runoff due to differences in land treatment. One season of grazing was sufficient to depress infiltration rates, though no significant changes were recorded in terms of potential sediment production under either grazing or burning. Soil moisture patterns were not significantly altered during the course of this study as a result of either the grazing or burning treatment.

ntifiers: *Universal soil loss equation, ewaunee River, *School Creek watershed, nvegetated.

e rates of erosion were estimated from a mber of nonvegetated roadsides by determining dcut geometry and substituting for parameters the universal soil loss equation. The average e of erosion from 104 separate sites was 354 s of soil per acre per year. The estimate was ified by measuring sediment yield from plot ablished on selected roadsides. Differences in dibility between surface soils and subsoils, iations associated with the length of the sam-g period, and variations in rainfall patterns ac-nted for the differences between measured and dicted erosion rates. y-one species of fishes from 11 families were cted. In most samples, cyprinids and stomids dominated the catch numerically and veight. The streams supported only limited bers of game fishes, channel catfish being the important of these. Catches were highly vari- and there was no strong correlation between s fish abundance, measured in catch/effort, either stream sinuosity or gradient. The ce of dominant species shifted according to ent, however. Young-of-year fishes were abundant in meandering stream segments, here was a significant (P = .01) positive cor-on between channel sinuosity and catch of ju-e fishes. Most of the species collected were le stream types or were wide-ranging in dis-tion. These fishes exhibited affinities for a bottom and tended to be negatively corre- with gradient, variance of velocity and oc-nce of a pool-riffle sequence. An Ozarkian yofaunal element was more prominent in the r gradient, firmer bottomed woodland ms. The species diversity index tended to be ssed at high water levels and in situations of urbidity, reflecting lower sampling efficiency such conditions. Species diversity, mea- both in terms of numerical abundance and ass, was generally greatest in unchannelized woodland stream segments. There was little difference in this index between natural and channelized prairie stream stations. Species diversity, therefore, appeared to be primarily a function of stream gradient. Pectoral fin-clipped fishes were recaptured in higher percentages in natural stream segments than in channelized areas. Additionally, there was evidence for greater fish movement between proximate channelized stations than between natural areas. These data suggest that there is greater fish movement throughout straightened reaches. Condition factor and length-weight relationships of channel catfish, carp and river carpsucker showed little difference between collections from channelized and unchannelized areas. This may be attributable to extensive movements of the fishes between the two habitat types. (FWS)

A STUDY OF THE EFFECTS OF STREAM CHANNELIZATION AND BANK STABILIZATION ON WARMWATER SPORT FISH IN IOWA: SUBPROJECT 4: THE EFFECTS OF LONGREACH CHANNELIZATION ON HABITAT AND INVERTEBRATE IN SOME IOWA STREAMS,
Iowa Cooperative Fishery Unit, Ames.
D. Zimmer, and W. Bachmann.
Report FWS/OBS-76-14, May 1976. 87 p, 7 fig, 8 tab, 24 ref, 2 append. FWS 14-16-0008-745.

Descriptors: *Channeling, Rivers, Streams, *Iowa, *Habitats, Invertebrates, *Channel morphology, Flow rates, Shore-line cover, Streambed, Bedform.
Identifiers: *Long-reach channelization, *Stream channelization, *Invertebrate drift, Gradients, Sinuosity, Habitat diversity, Depth, North Raccoon River, Big Cedar Creek, Hardin creek, Buffalo Creek, North Branch Cedar Creek, Boone River, Cedar Creek, Lizard Creek, Stream cover, Sinuosity, Stream type.

Relationships between channel morphometry, habitat diversity, and invertebrate drift density were studied in 11 natural and channelized stream segments of the upper Des Moines River Basin during 1974 and 1975. Gradients of the study sites ranged from 0.17 to 2.18 m/km; sinousity index values were between 0.95 and 1.67. The most obvious effect of channelization on stream habitat was a reduction in the diversity of water depth and current velocity. There was a significant (P=.05) positive correlation between channel sinuosity and the variability of stream depth and velocity. Invertebrate drift density, expressed as biomass and total counts, was also correlated with channel sinuosity. Sinuous streams had greater concentrations of drifting organisms than did straight channels. There was no relationship between drift density and channel gradient. The impact of channelization on habitat diversity and invertebrate drift density might be minimized if channels were designed with greater sinuosity index values. (FWS)

A STUDY OF THE EFFECTS OF STREAM CHANNELIZATION AND BANK STABILIZATION ON WARMWATER SPORT FISH IN IOWA: SUBPROJECT NO. 3 SOME EFFECTS OF SHORT-REACH CHANNELIZATION ON FISH AND FISH FOOD ORGANISMS, IN CENTRAL IOWA WARM WATER STREAM,
Iowa Cooperative Fishery Unit, Ames.
L. R. King, and K. D. Carlander.
Report FWS/OBS-76-13, April 1976. 217 p, 6 fig, 19 tab, 28 ref, append. FWS 14-16-0008-745.

Descriptors: *Channeling, *Fish food organisms, Fish, *Iowa, Streams, Rivers, Channel morphology, Dissolved oxygen, Turbidity, Flow rates, Invertebrates, Benthos, Benthic fauna, Plankton, Aquatic populations, Food habits, Bridge construction, Shore-line cover, Discharge(Water), Sampling, Bullheads, Catfishes, Channel catfishes, Sunfishes, Bass, Carp, Minnows, Rough fish, Fish types, *Bank stabilization.
Identifiers: *Stream channelization, Beaver Creek, Black Hawk Creek, Tipton Creek, Honey Creek, South Fork Iowa River, Short-reached channelization, Stream cover.

Six central Iowa streams were studied in 1974 to determine whether fish and fish food organisms were affected by short-reach channelization associated with bridge replacement in the last 15 years. In all cases the streams had been previously modified in the original bridge construction. The recent construction involved loss of 151 to 429 m of stream length in three streams and in the other streams the new channel was the same length as before. This would involve a loss of up to 18% of the stream if a bridge were built on each section line. Downstream the channel was narrower and shallower and perhaps had less brush shelter than upstream from the channel. Brush shelter was lacking in 2 of the 3 streams channelized in the last 2 years but had recovered somewhat, but not completely, in those channelized 10-15 years earlier. There was no evidence that dissolved oxygen, turbidity, or stream macroinvertebrates as measured by core, drift or artificial substrate samples differed upstream, in the channel, or below. Reduction of brush substrate in the channel and downstream would mean reduction in invertebrate production, however. More fish species were collected by electroshocking in unchannelized than in channelized localities in 5 of the 6 streams and in the 6th the number of species was the same in both localities. In 2 recently channelized streams that lacked cover in the channel, catches of fish were significantly less in the channelized than in the unchannelized localities, but in 3 streams channelized 10 to 15 years where some cover had developed, catches in the channel runs were similar or significantly greater than in unchannelized runs. In the unchannelized locations, however more of the fish were in brush and total populations were not adequately represented by electroshocking in the runs. The most evident impact of short-reach channelization is the removal of cover in the altered area and the loss of stream length. (FWS)

A STUDY OF THE EFFECTS OF STREAM CHANNELIZATION AND BANK STABILIZATION ON WARMWATER SPORT FISH IN IOWA: SUBPROJECT 2. A STUDY OF THE IMPACT OF SELECTED BANK STABILIZATION STRUCTURES ON GAME FISH AND ASSOCIATED ORGANISMS,
Iowa Cooperative Fishery Unit, Ames.
A. L. Witten, and R. V. Bulkley.
Report FWS/OBS-76-12, May 1976. 116 p, 7 fig, 15 tab, 23 ref, 4 append. FWS 14-16-0008-745.

Descriptors: *Bank stabilization, *Retaining walls, *Iowa, *Jetties, Streams, Rivers, *Channel morphology, Water temperature, Turbidity, Invertebrates, Benthos, Fish food organisms, Flow rates, Aquatic populations, Depth, Channel catfish, Catfishes, Bullheads, Sunfishes, Size, Populations, Mayflies, Caddisflies, Structures, Fish.
Identifiers: Skunk River, Soldier River, Wire retard, Permeable jetties, Impermeable jetties, Black bullhead, Green sunfish, *Stream channelization, *Retards, *Fish habitats.

Four types of bank stabilization structures installed mainly for highway protection--revetments, retards, permeable jetties, and impermeable jetties--were studied during the summer and fall of 1974 to determine their impact upon game fish habitat in Iowa streams. Stream width, depth, current velocity, water temperature, and turbidity were measured. Permeable jetties and retards deepened the channel near the structures. Maximum stream depth at or near these structures was from 7 to 110% greater than maximum depth in control sections of the streams. No other signifi-

cant differences in physical parameters between structured and non-structured sections of stream were found. No significant differences (P=0.99) were found in mean body length or abundance of channel catfish (Ictalurus punctatus), black bullhead (Ictalurus melas), and green sunfish (Lepomis cyanellus) between structured and non-structure sections of stream. Unusually high water during the sampling period may have allowed fish to remain dispersed throughout the streams rather than concentrating in the deeper pools at or near some of the stabilization structures, as might be expected in a drier year. Rock revetments and impermeable jetties fostered the growth of some invertebrates (primarily mayflies and caddisflies); these invertebrates were also found in a large percentage of game fish stomachs examined. Revetments, which presented the most rock surface for invertebrate colonization, had the gratest impact on invertebrate abundance A long rock jetty, extending far enough into the stream to produce a scour hole, would combine most of the advantages noted in the structures studied. From the standpoint of habitat improvement, rock seems superior to steel as a construction material, and structures which cause the formation of scour holes superior to those which do not deepen the stream. (FWS)

Identifiers: *Stream channelization, Habitat diversity, Sinuosity, Species diversity, Long-reach channelization, Short-reach channelization, Invertebrate drift, Stream cover, Gradient.

Summarized are results given in 5 other subproject reports. Studies were conducted from 1973 to 1976 to determine the extent of stream channelization in Iowa, differences in populations of fish and fish-food organisms in channelized and unchannelized streams, effects of stream alterations for highway bridge construction, and the value of stream-bank stabilization structures to fish habitat. Over 1000 miles of stream capable of supporting permanent fish populations were lost in Iowa through stream channelization. Channelization resulted in more uniform water depth and current velocity in the resulting stream with a reduction in habitat diversity. Sinuous streams had greater concentrations of drift organisms than did straightened channels. More species of fish were found in natural sections, although fish were as abundant in short-reach sections (ca. 0.5 km) channelized 10-15 years ago as in natural sections wherever brush piles and trees had accumulated in the stream. Certain structures installed in Iowa streams to protect highway bridges improved fish habitat by producing scour holes and providing cover and substrate for fish-food organisms. No additional long-reach (1.0 km) channelization should be conducted+ effects of short-reach projects can be lessened by leaving as much meander in the stream as possible and by proper placing and design of bank-stabilization strucutures. SEDIMENT DISCHARGE FROM HIGHWAY CUT-SLOPES IN THE LAKE TAHOE BASIN, CALIFORNIA, 1972-74,
Geological Survey, Menlo Park, Calif.
C. G. Kroll.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-255 225, $5.00 in paper copy, $3.00 in microfiche. Water-Resources Investigations 76-19, May 1976. 85 p, 14 fig, 13 tab, 18 ref.

Descriptors: *Sediment transport, *Erosion rates, *Road construction, *Lake basins, Streamflow, Drainage systems, Highways, Data collections, Sediment yield, Slopes, *California.
Identifiers: *Lake Tahoe basin(Calif), Highway cut-slopes.

Streamflow and fluvial-sediment discharge data were collected at selected streams and highway gutters in Lake Tahoe basin, Calif., to determine the extent of erosion from highway cuts and to attempt to evaluate the effects of various land-treatment practices to reduce erosion. Estimate of long-term annual total-sediment discharge from six streams into the lake is 7,100 tons, of which 2,300 tons is finer than 62 micrometers. During 1972-74, snowmelt runoff (April-July) accounted for 65 percent of the water and sediment discharge. Approximately 90 percent of the sediment is transported in suspension. Sediment measured at 16 gutterflow stations at the base of highway cut-slopes indicates that less than 100 tons of fine sediment per year are contributed to the lake from all California State highway cuts. Sediment-transport rates are highly variable, and an unknown part of the measured sediment was derived from sources other than highway cuts. Data were not adequate to demonstrate the effectiveness of treatments to stabilize cut-slopes. (Woodard-USGS)

Identifiers: *Algal colonization, Jena, *Saale River(E Germany).

The physiography, hydrography, geology and humand population density of the area (in East Germany) are described and daily water flow and global radiation measurements from 1963-1968 are analyzed. Monthly tests were conducted with water samples from 2 points in which water temperature, actual O2 content, 48 h O2 consumption, NH4, NO2, NO3, orthophosphate, Cl, Ca and Mg levels, carbonate hardness, pH values and KMnO4 consumption were determined. Annual variations in these values and the effect of city waste on these factors were correlated.--Copyright 1975, Biological Abstracts, Inc.

ENVIRONMENTAL FACTORS INFLUENCING ISOLATION OF ENTEROVIRUSES FROM POLLUTED SURFACE WATERS,
New Hampshire Univ., Durham. Dept. of Microbiology.
T. G. Metcalf, C. Wallis, and J. L. Melnick.
Appl Microbiol. 27(5), p 920-926, 1974.

Descriptors: *Isolation, *Viruses, *Enteric bacteria, Pollutant identification, *Texas, Treatment facilities, Bays, Environmental effects, Waste water treatment.
Identifiers: Enteroviruses, *Galveston Bay(Tex), Picornaviruses, Houston area(Tex).

The influence of water quality upon the concentration of virus on location was assessed in field studies conducted in the Houston ship channel, Galveston Bay, and Houston waste treatment plants in Texas. Clarification of polluted surface waters was accomplished with minimal loss of virus. Virus from clarified sewage effluents and saline waters was then adsorbed and concentrated on textile and membrane filter surfaces. Direct measurements of virus from large volumes of polluted surface waters under existing field conditions were then made using the virus concentrator equipment.--Copyright 1974, Biological Abstracts, Inc.

EVALUATING THE MEMBRANE FECAL COLIFORM TEST BY USING ESCHERICHIA COLI AS THE INDICATOR ORGANISM,
Missouri Univ., Rolla. Life Science Lab.
J. B. Hufham.
Appl Microbiol. 27(4), p 771-776, 1974.

Descriptors: *Coliforms, E. coli, Evaluation, Filtration, *Bioindicators, *Membranes, *Filters, *Pollutant identification, Testing procedures.
Identifiers: *Enterobacter-Aerogenes, *Membrane filter method.

The fecal coliform membrane filter method (MFC) currently used in water pollution analysis was evaluated using 2 strains of E. coli, a known fecal coliform, as the indicator organism. A large relative error in the results obtained with this method was dependent upon the brand of membrane filter employed, the medium, and the temperature of incubation. MFC densities varied between 10 and 60% of the densities determined by total bacteria counts and total coliform counts performed at 35 degrees C. Due to the large relative error encountered, the MFC method cannot be recommended as an analytical tool for the laboratory enumeration of E. coli. The MFC method can be used at 35 degrees C for enumeration of E. coli and for differential counts of E. coli and Enterobacter aerogenes.--Copyright 1974, Biological Abstracts, Inc.

MERCURY IN WADERS FROM THE WASH,
Nature Conservancy, Abbots Ripton (England). Monks Wood Experimental Station.
J. L. F. Parslow.
Environ Pollut. 5(4), p 295-304, 1973.

Descriptors: *Mercury, Europe, *Pollutant identification, *Wading birds, Seasonal, Water pollution effects, Industrial wastes, Heavy metals.
Identifiers: Calidris-Alpina, Calidris-Canutus, Liver, Tringa-Totanus, Wash(England).

Concentrations of total Hg were determined in the livers of 73 waders (Limicolae) collected during Aug.-March on the Wash, eastern England, in order to obtain baseline data on levels of this element in birds living in a non-industrial and presumably lightly polluted estuarine area. In the knot (Calidris canutus), Hg levels were relatively low, about 1 ppm dry weight, in early autumn but increased through the winter until, by Feb.-March, they were about 10-20 times higher. On more limited or scattered data, the dunlin (C. alpina) and redshank (Tringa totanus) also showed much higher Hg levels in late winter compared with autumn. Hg accumulated in the liver during the winter months (When the birds are exclusively estuarine, mainly in temperature latitudes) is probably eliminated in summer (on mainly inland arctic and subarctic breeding grounds). The results are discussed in relation to the molt, movements and food of the main species. The biological significance of the concentrations found in the Wash waders is uncertain, but it is suggested that in industrial estuaries Hg levels in the same species may be very much higher and, by analogy with other species, could be having detrimental physiological effects.--Copyright 1974, Biological Abstracts, Inc.

THE CHEMISTRY OF 700 YEARS OF PRECIPITATION AT DYE 3, GREENLAND,
Army Cold Regions Research and Engineering Lab., Hanover, N. H.
J. H. Cragin, M. M. Herron, and C. C. Langway, Jr.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A014 970, $3.50 in paper copy, $3.00 in microfiche. Research Report 341, July 1975. 22 p, 5 fig, 9 tab, 30 ref, 1 append. NSF AG-212, AG-394.

Descriptors: *Precipitation(Atmospheric), *Snow, *Aerosols, *Chemical analysis, *Air pollution, Dusts, Fallout, Lead, Chemistry, Path of pollutants, Instrumentation, Analytical techniques, Ice, Sulfates, Sodium, Deposition(Sediments), Pollutants.

UNIV. OF ILL. URBANA-CHAMPAIGN

Identifiers: *Ice cores, *Dye-3(Greenland), *Surface snow, *Snow chemistry, Atmospheric transport, Ice sheets, Pollutant lead aerosols, Sea salt, Terrestrial dust, Pollutant sulfur aerosols, Greenland snow deposits.

Concentrations of sodium, potassium, magnesium, calcium, silicon, aluminum, lead and sulfate were measured in surface snow and in individual annual accumulation layers from a 373-m-deep ice core from Dye 3, Greenland, covering the time period from 1232 to 1971 A.D. Average background (pre-1840) concentrations in micrograms/liter are: Na, 12.9 + or - 9.3; K,2.2 + or - 2.1; Mg, 1.5 + or - 1.0; Ca, 4.8 + or - 2.4; Si, 12 + or - 6; Al, 3.3 + or - 1.4; Pb, 0.07 + or - 0.06; and S04, 56 + or - 22. Deviations are due mainly to the variability of the concentrations in the samples deposited over the stated time interval rather than analytical precision. Observed concentrations of sodium, potassium, magnesium, calcium, silicon and aluminum can be adequately explained by relative abundances of these elements in seawater and terrestrial dust. Late 19th century annual ice layers contain twice as much sulfate as pre-1840 deposits, reflecting the increased use of fossil fuels in the Northern Hemisphere. Lead concentrations in post-1955 snow deposits are more than an order of magnitude greater than pre-1840 baseline concentrations and are attributed to smelting and the increased use of lead alkyls in gasoline. (Henley - ISWS)
W76-12181

COMPARATIVE SURVIVAL OF INDICATOR BACTERIA AND ENTERIC PATHOGENS IN WELL WATER,
Montana State Univ., Bozeman. Dept. of Microbiology.
G. McFeters, G. K. Bissonnette, J. J. Jezeski, C. A. Thomson, and D. G. Stuart.
Appl Microbiol. 27(5); p 823-829, 1974.

Descriptors: *Bioindicators, Water wells, Bacteria, *Pathogenic bacteria, Coliforms, *Enteric bacteria, Water supply, Membranes, Pollutant identification, Water pollution, Salmonella, Streptococeus, Shigella.
Identifiers: Aeromonas-Sp, Flexneri, Vibrio-Cholerae.

The comparative survival of various fecal indicator bacteria and enteric pathogens was studied in a stable well water supply by using membrane chambers. There was more variation in the 29 coliform cultures and they died more rapidly, as a group, than the 20 enterococcus cultures that were examined. The comparative survival of the organisms tested follows: Aeromonas sp.> the shigellae (Shigella flexneri, S. sonnei, and S. dysenteriae) >fecal streptococci>coliforms = some salmonellae (Salmonella enteritidis serotype paratyphi A and D, S. enteritidis serotype typhimurium)>Streptococcus equinus>Vibrio cholerae>Salmonella typhi>Streptococcus bovis> Salmonella enteritidis serotype paratyphi B. S. bovis had a more rapid die-off than did S. equinus, but both had significantly shorter half-live than the other streptococci. The natural populations of indicator bacteria from human and elk fecal material declined similarly to the pure cultures tested, whereas the die-off of fecal streptococci exceeded the coliforms from bovine fecal material.--Copyright 1974, Biological Abstracts, Inc.

CARBON CONTENTS OF SURFACE AND UNDERGROUND WATERS IN SOUTH-CENTRAL MINNESOTA,
Minnesota Univ., Minneapolis. Dept. of Civil and Mineral Engineering.
W. J. Maier, R. G. Gast, C. T. Anderson, and W. W. Nelson.
Journal of Environmental Quality, Vol. 5, No. 2, p 124-128, April-June 1976. 1 fig, 6 tab, 23 ref.

Descriptors: *Pollutant identification, *Organic compounds, *Carbon, *Water quality, *Minnesota, *Biochemical oxygen demand, Analytical techniques, Organic matter, Water pollution, Surface runoff, Surface drainage, Water supply, Underground streams, Groundwater, Tile drains, Waste treatment, Tile drainage, Seasonal, Tiles.
Identifiers: Cottonwood River(Minn), Redwood River(Minn), *Total organic carbon, Carbon contents, South-central Minesota, *Organic carbon, *Inorganic carbon, Underground waters, Seasonal storage, Water quality characteristics, Carbon analysis, Beckman carbon analyzer, Drain tiles.

Data presented showed that the relatively ample supplies of water available from dependable stream flow in the upper Mississippi region will have to be supplemented on a seasonal basis by utilizing either surface or underground water storage. Such seasonal storage would affect the existing interflows of water between surface, subsurface, and groundwaters. It could also affect the temporal variations in chemical content of both surface runoff and storage waters. Analysis of the inorganic and organic C contents of surface, subsurface, and groundwater in the glaciated area of south-central Minnesota was conducted to determine the extent that seasonal interchange of surface and groundwaters may effect water quality. Organic C concentrations were 5-17, 1-6, and less than or equal to 2 mg/liter in surface, subsurface, and groundwaters, respectively, indicating that most organic materials are decomposed or retained in the upper layers of the soil with minimal transfer to groundwaters. The relatively high organic C concentration in surface waters was probably due to biodegradation of vegetation and animal tissues in stream channels or in top soil layers, marshes, and impoundments. Low organic C concentrations and relatively low flow volumes from tile drains indicated that their effect on organic C content of rivers in this area was minimal. (Henley - ISWS)
W76-12202

LEAD NITRATE POISONING IN THE CARP (CYPRINUS CARPIO L.):LOCALIZATION OF THE POLLUTANT IN THE BODY, (IN FRENCH),
Toulouse-3 Univ. (France). Laboratoire d'Ecophysiologi des Animaux.
M.-P. Gire, J. -F. Narbonne, and A. Serfaty.
Eur J Toxicol Environ Hyg. 7(2), p 98-103, 1974.

Descriptors: *Nitrates, *Lead, *Carp, *Spectrophotometry, *Pollutant identification, Poisons, Toxicity, Water pollution effects.
Identifiers: *Atomic absorption spectrophotometry, Lead nitrate.

The Pb content in various organs and tissues of the carp, a freshwater fish, was estimated during long-term experimental poisoning with lead nitrate. Samples were taken every wk for 6 wk. Pb was determined by atomic asorption spectrophotometry. Pb content varied considerably from tissue to tissue. The organs and tissues examined can be classified in this order of increasing Pb content: skeletal muscle, gonads, brain, heart, blood, liver and pancreas, bone, gills and abdominal kidneys.--Copyright 1975, Biological Abstracts, Inc.

PRINCIPLE OF A TECHNICAL DEVICE FOR THE STUDY OF TOXIC EFFLUENTS IN WATER POLLUTION, (IN FRENCH),
Toulouse-3 Univ. (France). Laboratoire d'Ecophysiologi des Animaux.
R. Labat, G. Dazarola, and A. Chatelet.
Bull Soc Hist Nat Toulouse. 109(1/2), p 163-170, 1973.

Descriptors: *Pollutant identification, *Toxicity, *Lethal limit, *Fish, *Respiration, Carp, Effluents, Water pollution effects, Perches, Instrumentation, Measurement
Identifiers: Perca-Fluviatilis, Tinca-Tinca, *Cardiac monitoring.

To quantify lethal concentrations of toxic materials, the lethal concentration for 50% of the test fishes was determined. The cardiac and respiratory frequencies of test fishes were studied while they were relatively free to swim in their medium. The species used were: Cyprinus carpio, Tinca tinca and Perca fluviatalis, armed with electrodes to follow the ECG and a little balloon to study respiration. These 2 parameters were regularly visualized and electronically registered, then analyzed. --Copyright 1975, Biological Abstracts, Inc.

AUTOMATIC DETERMINATION OF SULFATES BY AN IMPROVED NEPHELOMETRIC METHOD: APPLICATION TO THE DETERMINATION OF SO2 IN ATMOSPHERIC AIR AND OF SULFATES IN RAIN WATER, (IN FRENCH),
Institut d'Hygiene et d'Epidemiologie, Brussels (Belgium).
G. Verduyn, and A. Derouane.
Atmos Environ. 8(7), p 707-715, 1974.

Descriptors: *Pollutant identification, *Sulfates, *Rain water, Atmosphere, *Air pollution, Analytical techniques, Sulfur compounds, Automation, Oxides, Fluorometry.
Identifiers: *Nephelometric method, Sulfur dioxide(Air).

An automatic nephelometric method for the determination of low concentrations of sulfate is described. It permits the determination of concentrations as low as 0.1 micro-g cm-3. The sulfate ions are precipitated by barium perchlorate. Fifty samples can be analyzed per h. This method was developed for the determination of sulfur dioxide in air after absorption in diluted hydrogen peroxide. It is applicable to the determination of sulfate amounts in rain water. The equipment used is the Technicon Auto Analyzer connected with a monochromators spectrofluorimeter.--Copyright 1975, Biological Abstracts, Inc.

TRACE METALS AND POLLUTION OF THE BELGIAN COAST AND OF THE SCHELDT ESTUARY, (IN FRENCH),
Institut Royal des Sciences Naturelles de Belgique, Brussels. Lab. for Oceanographic Physics.
E. Peeters, J. Das, M. Mertens, and M. A. Castiaux.
Bull Inst R Sci Nat Belg Biol. 49(13), p 1-13, 1973.

Descriptors: *Trace elements, *Metals, *Pollutant identification, *Spectrophotometry, Estuaries, Coasts, Nitrates, Nutrients, Phosphates, Neutron activation analysis, Copper, Chromium, Iron, Lead, Zinc, Nickel.
Identifiers: Belgian coast, Gadus-merlangus, Pleuronectes-platessa, Trachurus-trachurus, *Atomic absorption spectrophotometry, North Sea, Scheldt estuary(Belgium).

Atomic absorption spectrophotometric assay of various metals (Cr, Cu, Fe, Zn, Pb and Ni) was done on water of the North Sea and the Scheldt estuary. For some metals a comparison is made between atomic absorption assay values and neutron activation measurements. Cu and Zn were assayed in the organs of 3 common species of fish in the North Sea (Pleuronectes platessa, Gadus merlangus and Trachurus trachurus). These results are compared with nutrient salt concentrations (nitrates, nitrites and phosphates) in the same waters. Zn and Cu values were in the normal range, but high values were observed for trace metals, such as Cr, Ce, Co and Hg.--Copyright 1975, Biological Abstracts, Inc.

PRELIMINARY STUDIES OF ASBESTIFORM FIBERS IN DOMESTIC WATER SUPPLIES,
California Univ., Berkeley.
R. C. Cooper, and J. C. Murchio.
Available from the National Technical Information Service, Springfield, Va 22161 as ADA-011 855, $3.50 in paper copy, $3.00 in microfiche. Report AMRL-TR-74-125, Paper No. 5, December, 1974. p. 61-73. 3 fig., 7 ref.

Descriptors: Water quality, Laboratory tests, *Analytical techniques, *Water quality control, Water pollution sources, Water sources, *Water analysis, Water purification, *Asbestos, Mine wastes, Surface waters, Water supply, *Domestic water, *Pollutant identification, *Electron microscopy.
Identifiers: *Asbestiform fibers, Asbestos fiber analysis.

Nineteen water samples were collected in California, five from Houston, Texas, one from Wisconsin, and nine from Duluth, Minnesota, and were examined for their asbestiform fiber content. Analysis was by electron microscope. One can predict the occurrence of these matrials by understanding the geology of the watersheds and the industrial operations that are in process. Analysis of results from northern California water supplies indicate that water supplies exposed to large outcroppings of serpentine rock can contain considerable amounts of chrysoltile asbestos fibers. SAMPLING AND CALCULATION METHODS FOR DETERMINING QUANTITIES OF NITROGEN AND PHOSPHORUS IN WATERSHED RUNOFF,
Agricultural Research Service, Columbia, Mo.
R. E. Burwell, G. E. Schuman, R. F. Piest, W. E. Larson, and E. E. Alberts.
Presented at 1974 Winter Meeting of the American Society of Agricultural Engineers, December 10-13, 1974. Chicago, Illinois. 2 fig, 5 tab, 10 ref.

Descriptors: *Nitrogen, *Phosphorus, *Agricultural runoff, Sediments, Watersheds(Basins), *Sampling, *Path of pollutants, *Iowa, *Pollutant identification, Water pollution sources.

The nitrogen and phosphorus content of surface runoff from two watersheds in southwestern Iowa was analyzed for a 5-year period (1969-1973). Sampling and calculation procedures were evaluated for quantifying discharges of water-soluble NO3-N, NH4-N, and inorganic P and sediment-associated Kjeldahl N and NaHCO3-extractable P. The arithmetic mean nutrient concentration of samples collected during major runoff (greater than 10 cfs), multiplied by the quantity of water or sediment discharged, compared favorably with standard integration procedure for determining N and P discharge associated with surface runoff. (Skogerboe-Colorado State)

REMOTE SENSING OF MARINE HYDROCARBON SEEPS,
Barringer Research Ltd., Rexdale (Ontario). (Assignee).
A. R. Barringer.
U. S. Patent No. 3,961,187, 3 p, 3 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 947, No 1, p 435, June 1, 1976.

Descriptors: *Patents, Water pollution sources, *Remote sensing, *Seepage, Oceans, Resources development, Bioluminescence, Optical properties, Oil industry, Exploration, *Oil pollution, Nutrients, *Organic compounds, *Pollutant identification.

A method and apparatus is provided for detecting the presence of dissolved hydrocarbon gases in the ocean remotely from an aircraft or a boat. It has been discovered that frequently gas seeps are accompanied by increased optical scattering in the water and also by an increased concentration of microorganisms growing in the water. The most common gas to seep from the sea floor is methane which provides an excellent nutrient for certain types of bacteria existing in the sea. These bacteria multiply rapidly and in turn provide an increased supply of nutrients for secondary growths of organisms that cannot be supported by methane along. An intense beam of light such as that generated by a laser is pointed downward from an over-flying aircraft. This beam of light preferably is pulsed, although a continuous source of light could be used with somewhat lesser effectivity. The wavelength of light chosen is in the blue or ultraviolet in order to achieve maximum sensitivity to scattering in the water and to stimulate bioluminescence in suspended microorganisms. The signal returned from the sea can be measured through a narrow band filter at the same wavelength as that of the emitting source to monitor turbidity and scattering. The bioluminescence emission can also be measured at a longer wavelength. An important feature is that surface and sub-surface reflections can be separated, because the surface reflections may be attributable to hydrocarbon slicks due to pollution, plankton, etc. instead of hydrocarbon seeps. Paperi ja Puu, Vol. 58, No. 4a, Special issue, p 211-214, 217-218, 221-222, 225, April, 1976. 8 fig, 11 ref, 7 tab.

Descriptors: *Pulp wastes, *Color, Wastes, Industrial wastes, Water pollution sources, Lignins, Carbohydrates, Water quality, *Chromatography, Softwood, Hardwood, Effluents, *Pollutant identification.
Identifiers: *Deckers(Pulp thickeners), Kraft mills, Board mills, Indulin(Alkali lignin).

Decker effluents from a kraft linerboard mill using 98% softwoods and 2% hardwoods (Interstate Paper Corporation, Riceboro, Georgia) were investigated. Concentrated solutions of freeze-dried solids from the colored effluets were acidified to give acid-insoluble and acid-soluble components which were further fractionated by gel permeation chromatography. Most of the color bodies were of ligninlike character and seemed to comprise lignin degraded to various degrees. The acid-insoluble color bodies contained a high proportion of carboxylic and/or ketonic carbonyl groups conjugated with aromatic rings, whereas the acid-soluble color bodies contained a nonconjugated COOH group and appeared to be associated with carbohydrate material. All isolated color bodies were negatively charged and showed mobilities higher than Indulin (alkali lignin), indicating a higher density of negative charge per molecule. (Brown-IPC)

ANALYSIS OF HIGH-PURITY WATER AND ACIDS BY SPARK SOURCE MASS SPECTROMETRY,
National Research Council of Canada, Ottawa (Ontario).
A. Mykytiuk, D. S. Russell, and V. Boyko.
Analytical Chemistry, Vol. 48, No. 11, p 1462-1464, September, 1976. 1 fig, 5 ref, 3 tab.

Descriptors: *Water analysis, *Inorganic compounds, *Acids, *Mass spectrometry, Analytical techniques, Sulfur, Chlorine, Bromine, Boron, Laboratory equipment, Trace elements, Water pollution sources, Water chemistry, Water properties, Spectroscopy, Plastics, Pollutant identification.
Identifiers: Hydrochloric acid, Hydrofluoric acid, Nitric acid, Teflon, Vycor, Poly-4-methylpentene-1.

A convenient method for determining the trace inorganic impurities in high-purity water, hydrochloric, hydrofluoric, and nitric acids is described. The samples are concentrated in a Class 100 environment and the resulting residues are examined in a spark source mass spectrograph. Approximately 25 elements are usually detected above the concentration of 0.005 nanogram/gram (0.005 parts per billion). The technique permits the determination of sulfur, chlorine, bromine, and boron in water. Polypropylene and poly-4-methylpentene-1 beakers introduced less contamination than did those of linear polyethylene, Teflon, and Vycor. (Witt-IPC)

GAS-LIQUID CHROMATOGRAPHIC DETERMINATION OF 3-TRIFLUOROMETHYL-4-NITROPHENOL IN NATURAL WATERS,
Canada Centre for Inland Waters, Burlington (Ontario).
J. A. Coburn, and A. S. Y. Chau.
Journal Association of Official Analytical Chemists, Vol. 59, No. 4, p 862-865, July, 1976. 1 fig, 9 ref, 2 tab.

Descriptors: *Pesticides residues, *Water analysis, *Gas chromatography, Water pollution sources, Trace elements, Lampreys, Natural streams, Water chemistry, *Phenols, Great Lakes, Analytical techniques, Chromatography, Ion exchange, *Pollutant identification.
Identifiers: 3-Trifluoromethyl-4-nitrophenol, *Lampricides.

3-Trifluoromethyl-4-nitrophenol (TFM) is used for the control of sea lamprey in the Great Lakes. A procedure for the analysis of this compound in natural waters is described. The lampricide is extracted from acidified water samples on the macroreticular resin XAD-7 and eluted from the column with ethyl ether. The ether extract is dried, concentrated, and partitioned with potassium carbonate. TFM is acetylated in the aqueous alkaline solution and the acetate derivative is extracted into benzene for analysis by electron capture gas-liquid chromatrography. Recoveries of TFM from natural waters exceeded 90%, and as little as 0.01 microgram TFM can be detected in a 1 liter sample. (Witt-IPC)

BUBBLE TUBE: APPARATUS FOR DETERMINING RATE OF COLLECTION OF BACTERIA BY AIR BUBBLE RISING IN WATER,
State Univ. of New York at Albany. Atmospheric Sciences Research Center.
D. C. Blanchard, and L. D. Syzdek.
Limnol Oceanogr. 19(1), p 133-138, 1974.

Descriptors: *Bacteria, *Pollutant identification, Bubbles, Air, Apparatus, Data collections, Analytical techniques.
Identifiers: Serratia-Marescens, *Air bubbles, Bubble tube.

An air bubble rising through a bulk suspension of bacteria can be made to rise into a tube containing sterile water, which can then be cultured to determine the number of bacteria carried by the bubble. If the distance of bubble rise is varied, data are obtained from which both the attachment rate of bacteria to the bubble and the collection efficiency can be calculated. For a bubble of about 1-mm diameter rising through a suspension of Serratia marcescens, the collection efficiency is about 0.1%.--Copyright 1974, Biological Abstracts, Inc.

DETERMINATION OF CHLORINE DIOXIDE AND OTHER ACTIVE CHLORINE COMPOUNDS IN AQUEOUS SOLUTIONS (OZNACZANIE DWUTLENKU CHLORU ORAZ INNYCH AKTYWNYCH ZWIAZKOW CHLORU WROZTWORACH WODNYCH),
K. Ascik, and M. Glinska.
Przeglad Papierniczy, Vol. 32, No. 4, p 145-147, April, 1976. 1 fig, 8 ref.

Descriptors: *Water analysis, Water chemistry, Trace elements, Chlorine, Sodium arsenite, Hydrogen ion concentration, Water pollution sources, Electrodes, *Analytical techniques, *Pollutant identification, Volumetric analysis.
Identifiers: *Chlorine compounds, *Amperometric titration, *Chloramine, *Chlorine dioxide, *Chlorites, Hypochlorites.

The method described, intended primarily for the analysis of water containing low concentrations of chlorine compounds, makes it possible to determine active chlorine, chloramine, chlorine dioxide, and chlorite by 4 consecutive amperometric titrations with sodium arsenite solution. Active chlorine (free chlorine + hypochlorite + hypochloric acid) is titrated after chlorine dioxide has been eliminated by hydrolysis at pH 11, and the sample neutralized to pH 7. Titration under the same conditions but in the presence of KI gives the amount of free chlorine + chloramine. Titration at pH 7 without preliminary alkaline hydrolysis and in the presence of KI gives free chlorine + chloramine + 20% chlorine dioxide. And finally, free chlorine + chloramine + chlorine dioxide + chlorite are determined in a sample acidified to pH 2 and then neutralized to pH 7. The principles of the consecutive titrations are discussed, and a description is given of the analytical procedure and the apparatus used (a silver electrode immersed in a solution of NaCl in a glass tube, and a platinum electrode in the form of a wire wound about lower porous part of the tube). The method is rapid (about 20 min) and accurate. The error is less than 0.01 ppm. (Stapinski-IPC)

Identifiers: Budapest, *Danube River, Danubialia Hungarica, Hungary, Kilometer, Romania, Severin, Turnu.

The pH, alkalinity, carbonate hardness, noncarbonate hardness, hydrogen carbonate ion, total hardness, C ions, Mg ions, SiO2, chloride ion, ammonium, nitrite, nitrite ions and O2 consumption were measured at 24 locations above and below the mouth of the Save (in Hungary and Romania), a tributary of the Danube, from July 1 to 24, 1971. The findings are compared with those obtained along the Save. Below the mouth of the Save, the ammonium ion content decreased to 1/3, the nitrite ion content practically doubled and the average values for nitrite ions and SiO2 rose slightly. The amount of chloride ion, in contrast with the Ca, Mg and hydrogen carbonate ions, also increased in a downstream direction.--Copyright 1975, Biological Abstracts, Inc.

DISSOLVED NUTRIENT LOSSES IN STORM RUNOFF FROM FIVE SOUTHERN PINE WATERSHEDS,
Agricultural Research Service, Oxford, Miss. Sedimentation Research Lab.
J. D. Schreiber, P. D. Duffy, and D. C. McClurkin.
Journal of Environmental Quality, Vol 5, No. 2, p 201-205, 2 fig, 6 tab, 21 ref.

Descriptors: *Nutrients, Water quality, Chemistry of precipitation, Baseline studies, *Nitrogen, *Phosphorus, *Cations, Cycling nutrients, *Storm runoff, Pine trees, *Mississippi, Forest watersheds, Coastal plains, Watersheds(Basins), Water analysis, Water chemistry, Pollutant identification, Path of pollutants.
Identifiers: *Nutrient net gain or loss, Nutrient flux, Coastal Plain watersheds.

Storm runoff from five reforested eroded watesheds in northern Mississippi (1.5 to 2.8 ha) was analyzed during the 1973 water year to determine the concentrations of soluble NO3-N, NH4-N, PO4-P, Ca, Mg, and K. Storm runoff was measured with 0.91-m H-flumes and samples were collected with a Coshocton wheel sampler. Analysis of precipitation which totaled 189 cm for the year, 40% above average, revealed that inputs of NO3-N, NH4-N, PO4-P, Ca, Mg, and K for the year were 3.12, 5.73, 0.07, 7.72, 3.03, and 4.98 kg/ha, respectively. Soluble nutrient losses in the storm runoff on a unit area basis were similar for the five watersheds. Average losses in storm runoff of soluble NO3-N, NH4-N, PO4-P, Ca, Mg, and K for the year were 0.32, 3.35, 0.04, 6.21, 3.05, and 3.31 kg/ha, respectively. As the annual storm runoff among the watersheds increased, the NO3-N losses also increased linearly. Data for individual storms indicated that a critical storm runoff value must be exceeded before the watersheds would exhibit a net loss of each nutrient. (Forest Service)

DEGRADATION OF DDT IN AN EVERGLADES MUCK AS AFFECTED BY LIME, FERROUS IRON AND ANAEROBIOSIS,
Agricultural Research Service, Baton Rouge, La.
J. F. Parr, and S. Smith.
Soil Sci. 118(1), p 45-52, 1974.

Descriptors: *DDT, *DDD, *Lime, *Iron, Respiration, Bacteria, Aerobic condition, Anaerobic conditions, *Degradation(Decomposition).
Identifiers: *Anaerobiosis, *Everglades muck.

DDT degraded slowly (less than < 5% recovered as DDD) in an Everglades muck amended with alfalfa meal and incubated for 4 wk under moist aerobic, moist anaerobic, and flooded anaerobic (unstirred) conditions. Degradation was more extensive in a flooded anaerobic environment subjected to continuous stirring where about 14% of the DDT was recovered as DDD. Liming the muck from pH 5.3 to 6.8 caused a greated conversion of DDT to DDD in the moist anaerobic environment than did the application of ferrous Fe, while the opposite was true for the flooded anaerobic environment. DDT degradation was greatest where muck was amended with alfalfa meal, lime and Fe2+ and followed the order of flooded anaerobic (stirred)>flooded anaerobic (unstirred)>moist anaerobic. Recovery of DDD from these environments was approximately 56, 32 and 10%, respectively. Lime caused a marked increase in bacterial populations in the anaerobic environments and was correlated with greater respiratory activity and increased DDT degradation. The application of Fe2+ particularly to flooded anaerobic muck samples appeared to substantiate a chemical mechanism for conversion of DDT to DDD. The extent of DDT degradation increased as the redox potential (Eh) decreased. --Copyright 1974, Biological Abstracts, Inc.

Descriptors: *Path of pollutants, *Pesticide residues, *Herbicides, Soils, *Adsorption, Inorganic compounds, Pollutant identification, Decomposing organic matter, Humus.

The movement and adsorption of these herbicides are dependent on the physical and chemical properties of the compounds. The movement was greater with inorganic compounds whose basic structures are charged negatively (ClO3-, NH2SO3-). The degree of translocation in the soil was varied due to such factors as soil character, humus, rainfall, intensity of rainfall and inclination of land. Resulting from these experiments, chlorate, sulfamin and fatty acid type herbides showed bigger movement and small with phenoxy, benzoic type herbicides. Esterized compounds revealed extremely little movement; they were firmly adsorbed on the soil surface. The herbicides of high water solubility with negative charge were highly correlated with the movement of soil water. With regard to the residue (decomposition and inactivation) determination, 6 compounds tested were inactivated completely 4-14 wk when applied at standard dosage. The inactivation tends to be rapid with DPA (2,2-dichloro propionic acid) and slow with TFP (2,2,3,3-tetrafluoro propionic acid) and AMS (ammonium sulfamate). As the dosages increase, the term of residue was relatively prolonged especially with TFP, TBA (2,3,6-trichloro benzoic acid) and 2, 4, 5-T. Factors responsible for decomposition and inactivation were organic matters, soil water, humidity and light.--Copyright 1975, Biological Abstracts, Inc.

QUANTITY OF HETEROTROPHIC BACTERIA ON SOME HIGHER PLANTS IN CARP PONDS, (IN RUSSIAN),
Ukrainian Research Inst. of the Fish Industry, Kiev (USSR).
A. F. Antipchuk.
Gidrobiol Zh. 10(1), p 63-64, 1974.

Descriptors: *Bacteria, *Carp, Fish hatcheries, Distribution, Path of pollutants, Vegetation, Microorganisms, Detritus, Ponds.
Identifiers: *Heterotrophic bacteria.

A determination of the abundance and distribution of heterotrophic saprophytic bacteria on the most common plants in carp ponds established high concentrations of bacteria in the zone of higher aquatic vegetation, which probably can be regarded as a result of the utilization of the intravital excretions of plants and detritus accumulating in the vegetation zone by the microorganisms. This assumption was confirmed by the fact that there were more microorganisms on the plant leaves than on the stems.--Copyright 1975, Biological Abstracts, Inc.

A STOCHASTIC MODEL FOR PREDICTING THE PROBABILITY DISTRIBUTION OF THE DISSOLVED-OXYGEN DEFICIT IN STREAMS,
Geological Survey, Reston, Va.
I. I. Esen, and R. E. Rathbun.
Available from Supt. of Documents, GPO, Washington, D. C. 20402, $1.55. Professional Paper 913, 1976. 50 p, 24 fig, 13 tab, 23 ref.

Descriptors: *Model studies, *Biochemical oxygen demand, *Streams, *Waste water(Pollution), *Stochastic processes, Monte Carlo method, *Dissolved oxygen, Oxygen sag, Reaeration, Self-purification, Waste assimilative capacity, Water pollution, Water quality control, Forecasting.

A random walk model was developed for predicting the distribution of the biochemical-oxygen-demand for points downstream from a waste source for a stream system in which the deoxygenation coefficient is a normally distributed random variable. A Monte Carlo technique for simulating a random walk process was used for estimating the distribution of the dissolved-oxygen deficit at downstream points in a stream in which both the deoxygenation and reseration coefficients are normally distributed random variables. Equations for approximating the mean oxygen deficit and the variance of the oxygen deficit were developed by expanding the basic equation of the stochastic model in a Taylor series. The frequency distributions of the oxygen deficit predicted by the stochastic model became flatter and skewed to the right as time of travel increased. The critical time of travel estimated from the stochastic model was larger than the critical time of travel computed from the deterministic model. The variance of the oxygen deficit at the critical time of travel was largest for small ratios of the reaeration and deoxygenation coefficients and smallest for the large ratios. (Woodard-USGS)

V. O. Sheftel', and R. E. Sova.
Gig Sanit. 6, p 93-94, 1974.

Descriptors: Public health, *Plastics, Water temperature, Potable water, Chemical analysis, Hydrogen ion concentration, *Polymers, *Pollutant identification, *Path of pollutants.
Identifiers: *Caprolactam, *Caprolon, *Migration(Monomers).

The rate of migration of the monomer caprolactam was mathematically determined, in order to study the possibility of using caprolon articles in contact with drinking water. Migration was affected considerably by the water temperature and its contact time with the plastic. A change in pH of the water within limits permissible for drinking water does not affect migration of the monomer.--Copyright 1975, Biological Abstracts, Inc.

ntifiers: *Benzo(a)pyrene release.

e occurrence of benzo(a)pyrene (B(a)P) in mus- s has been found to be a good indicator for the ntamination of bodies of water with polycyclic matic hydrocarbons. It is important to know residence-time of the compound in the species ler investigation. Mussels were collected from a ntaminated location and transferred to clean er and release of B(a)P was determined. The ount of B(a)P, initially 45 micrograms/kg wet ght, declined approximately exponentially over 6 weeks of the experiment, with an overall f-life of 16 days. The residence time of B(a)P in ssels makes these mollusks attractive as bioac- ulators in monitoring programs for this and er carcinogens. (Katz)

NSPORT RATE OF COD THROUGH A POROUS STRATUM - MEASUREMENT DIFFUSIVITY IN CATTLE MANURE SOLU- N,
as State Univ., Manhattan. Dept. of Chemi- ngineering.
Choi, L. T. Fan, L. E. Erickson, and R. I. er.
sactions of the American Society of Agricul- Engineers, Vol. 14, No. 4, p. 720-726, July- st, 1971. 10 fig, 1 tab, 16 ref.

Descriptors: *Chemical oxygen demand, *Diffusivity, Water pollution, Percolation, Groundwater, Measurement, Mathematical models, *Farm wastes, *Path of pollutants.

The transport rate of materials through various soil strata is important for determining pollution potential of waterways by material introduced into the soil, at various distances from the water. A mathematical model and the equations derived from it are related to the transport of organic matter (expressed as chemical oxygen demand) through soil. The model used was packed bed, saturated with water and topped by a well mixed pool of homogeneous solution; both finite and infinite packed bed thicknesses are considered. Analytical expressions for concentration of a solute in the packed bed and in the homogeneous solution are given as a function of time, and of distance from the interface in the former case. Experimental data were obtained for a sucrose solution of known diffusivity in an experimental set-sup established in accordance with the model, and for a sterilized manure solution. (East Central)

ANIMAL WASTE AND NITRATE MOVEMENT THROUGH SOIL,
Connecticut Univ., Storrs. Dept. of Agricultural Engineering.
J. A. Lindley, A. C. Dale, and J. V. Mannering.
Presented at the 67th Annual Meeting, American Society of Agricultural Engineers, Oklahoma State University, Stillwater, June 23-26, 1974, 17 p. 6 fig, 11 tab, 6 ref.

Descriptors: Groundwater movement, *Nitrates, *Leaching, *Denitrification, Loam, Soil moisture, Water pollution sources, *Farm wastes, Path of pollutants, Application rates, Waste disposal.
Identifiers: *Land disposal, Silt loam, Sandy loam.

An evaluation of high application rates of animal wastes to land becomes necessary as the number of animals per acre of land increases. The application rate must be controlled to prevent ground water degradation. A laboratory study was done to evaluate the effects of waste management on nitrate movement through soil. The fate of nitrate is dependent on various conditions. The most important are soil moisture and the presence of sufficient organic matter for microbial activity. Soil type might also affect nitrate movement. Leachates of very low nitrogen concentration can be produced even with waste application of 24.6 pounds of nitrate per acre-day. The amount of nitrogen lost increases with increasing available energy (C:N ratio). (Kehl-East Central)

EFFECT OF CATTLE FEEDLOT WASTES UPON GROUND WATER--A COMMENTARY,
Texas Tech Univ., Lubbock. Dept. of Geosciences.
W. D. Miller.
In: Soil Conservation Service, Texas Tech University Workshop Committee on Feedlot Waste, Texas Tech University, Lubbock, July 28-29, 1971, 5 p. 3 fig.

Descriptors: *Feed lots, *Groundwater, *Seepage, Pollutants, Cattle, *Farm wastes, Water pollution control, Path of pollutants, Pollutant identification.

Several categories of potential ground water pollutants are listed. These include inorganic dissolved solids; organic dissolved solids; trace metals; pesticides, insecticides and herbicides; and bacteria and bacterially derived products. Along with the effects of these potential pollutants, the feedlot geology must be considered in discussing the effects of feedlot waste on ground water. Significant factors to be examined are: surface topography, soil permeability, bedrock lithology, structure and permeability, and depth of ground water. Thus, some land areas are more susceptible to ground water pollution than others. In Texas, cases of pollution have been documented in the Edwards Plateau, the Gulf Coast, and the High Plains. Further evaluation of the ground water pollution problem is needed. A study by Miller (1971) revealed that about 15-20 percent of the cattle feedlots in the Texas High Plains showed some evidence of seepage to the water table. Average nitrate, chlorides and dissolved solids concentrations are cited. (See also W76-12363) (Kehl-East Central)

ORGANIC MATTER LOSSES FROM FOUR WATERSHEDS IN THE HUMID TROPICS,
East Carolina Univ., Greenville, N. C. Dept. of Biology.
M. M. Brinson.
Limnology and Oceanography, Vol. 21, No. 4, p 572-582, July 1976. 5 fig, 1 tab, 24 ref.

Descriptors: *Organic matter, *Runoff, *Humidity, *Tropical regions, Sediments, Suspended solids, Watersheds(Basins), Precipitation(Atmospheric), Rivers, Lakes, Sampling, Erosion, Drainage, Carbon, On-site investigations, Surveys.
Identifiers: *Guatemala, *Lake Izabel catchment basin, Seasonal hydrologic runoff, Organic carbon export.

Organic matter (OM) losses in runoff water were examined for four watersheds in Guatemala, ranging in size between 170 and 5,247 sq km. Total organic matter (TOM) concentrations for the largest river were highest (14.8-19.3 mg/liter) at the beginning of the wet season, due to an abrupt increase in particulate fractions. This initial flushing effect was followed by lower concentrations which had decreased to near dry season values (3.90-5.35 mg TOM/liter) 4 months later. Export of TOM was estimated to be between 5.4 and 12 g/sq m/yr for three of the four watersheds. The fourth, dominated by swamp forest, showed a higher maximum concentration (43.7 mg TOM/liter) and greater export, the latter partially attributable to flushing by floodwaters that overflowed an adjacent watershed. These data and those from studies in higher latitudes suggested a direct relationship between the quantity of TOM exported and runoff volume per unit area of watershed. A plausible explanation was that dissolved OM is the major form of OM in most running waters and varies less in magnitude than hydrologic runoff from one watershed to another. (Sims - ISWS)

Water Resources Research, Vol. 12, No. 3, p 533-540, June 1976. 10 fig, 19 ref.

Descriptors: *Unsteady flow, *Dye releases, *Dye concentration, *Effluents, *Analytical techniques, *Turbulent flow, *Hudson River, *Mathematical models, Thermal pollution, Diffusion, Buoyancy, Density currents, Tidal waters, Equations, Pollutant identification, *Path of pollutants.
Identifiers: *Three-dimensional model, *Green's function, *Long Island Sound, Momentum.

A transient, three-dimensional turbulent diffusion equation describing the concentration distribution of a substance or heat in a time-dependent flow field was solved analytically. Two models were considered: one treated both the depth and the width of a water body as being finite, while the other dealt with finite depth but with infinite width. In the search for solutions, the method of Green's function was utilized to the optimum advantage. The solutions were developed for cases in which the velocity field can be described as any integratable function of time. For practical applications, the velocity was assumed to be the sum of a constant and a harmonic component. There were no limitations on the type of source conditions. Results were compared with field measurements and showed the models to be capable of simulating the dye distribution in tidal water bodies. The models should provide the engineering community with a quick and easy way of predicting the distribution of effluent discharges. They should obviate the need of using tedious and time-consuming numerical models, as occasions often arise in which such complicated models may not be warranted. (Lardner - ISWS)

AN ANALYSIS OF THE NUMERICAL SOLUTION OF THE TRANSPORT EQUATION,
Princeton Univ., N. J. Dept. of Civil Engineering.
W. G. Gray, and G. F. Pinder.
Water Resources Research, Vol. 12, No. 3, p 547-555, June 1976. 8 fig, 1 tab, 5 ref. NSF-AER74-01765.

Descriptors: *Mass transfer, *Dispersion, *Finite element analysis, *Numerical analysis, *Fourier analysis, Waves(Water), Convection, Computers, Equations, Mathematical studies, *Path of pollutants.
Identifiers: *Convective-dispersive equation, *Transport equation, Frontal smearing, Concentration overshoot, Finite difference methods.

The relative merits of numerical procedures used for the solution of the convective dispersive mass transport equation were examined in terms of frontal smearing and concentration overshoot. The testing for assessing the relative accuracy of some selected numerical procedures was based on a Fourier series representation of the solution to the governing equation and its discretized counterpart. Through a comparative examination of the analytically and numerically computed amplitude and speed of the Fourier components, the dispersive and dissipative properties of a numerical scheme were easily analyzed. The analysis indicated that the commonly observed phenomenon of overshoot of a concentration pulse was due to the inability of the numerical schemes to propagate the small wavelengths which are important to the description of the front. The numerical smearing of a sharp front was due to dissipation of these small wavelengths. The finite element method was found to be superior to finite difference methods for solution of the convective-dispersive equation. (Singh - ISWS)

PHOSPHORUS LOSS BY STREAM TRANSPORT FROM A RURAL WATERSHED: QUANTITIES, PROCESSES, AND SOURCES,
Pennsylvania Univ., Philadelphia.
A. H. Johnson, D. R. Bouldin, E. A. Goyette, and A. M. Hedges.
Journal of Environmental Quality, Vol. 5, No. 2, p 148-157, April-June 1976. 12 fig, 5 tab, 12 ref.

Descriptors: Phosphorus, *Phosphorus compounds, *Watersheds(Basins), *Sediment transport, *New York, *Phosphates, Analytical techniques, Fertilizers, Water pollution sources, Surface waters, Analysis, Chemical analysis, Water quality, Streams, Water pollution, Environmental effects, Analytical techniques, Algae, Land use.
Identifiers: *Phosphorus loss, *Stream transport, *Rural watersheds, Dissolved phosphorus, Particulate phosphorus, *Fall Creek(NY), Central New York, Nonsource point pollution, Stream sampling, Mineral constituents, Particulate forms.

Loss of dissolved and particulate phosphorus by stream transport was determined over a 20-month period for Fall Creek, a stream draining a predominantly rural watershed of 330 sq km in central New York. Samples were taken several times daily during most high flow periods and at 3 to 20 day intervals during low flow periods. Samples were usually processed within 4 hours since redistribution of P among chemical forms was rapid. Losses of P from the watershed per unit time varied by several orders of magnitude and 75% of the P loss occurred in the highest flow which occurred in 10% of the time. In reaches well downstream from major point source inputs, dissolved inorganic P concentrations were highest during storm events due to two processes: desorption of P accumulated in the bed sediment from point source inputs during low flow, and inputs from diffuse sources in surface runoff. Dissolved organic P concentrations were not correlated with flow. Approximately 20% of the dissolved P lost from the watershed was derived from diffuse sources associated with farming, 45% was derived from natural geochemical processes, and 35% from point source inputs. Less than 1% of the P applied to the landscape in chemical fertilizer and manure was lost from the watershed in dissolved form. (Henley - ISWS)
W76-12435

DISSOLVED NUTRIENT LOSSES IN STORM RUNOFF FROM FIVE SOUTHERN PINE WATERSHEDS,
Agricultural Research Service, Oxford, Miss. Sedimentation Lab.
J. D. Schreiber, P. D. Duffy, and D. C. McClurkin.
Journal Environmental Quality, Vol. 5, NO. 2, p 201-205, April-June 1976. 2 fig, 6 tab, 21 ref.

Descriptors: Nutrients, *Storm runoff, *Water quality, *Cycling nutrients, *Nutrient removal, Nitrates, Phosphats, Chemical analysis, Leaching, Runoff, Water properties, *Watersheds(Basins), Rain, Precipitation(Atmospheric), Rainfall-runoff relationships, Cations, Baseline studies.
Identifiers: *Nutrient losses, *Southern pine watersheds, Northern Mississippi, Watershed studies, *Nutrient flux, *Coffeeville(Miss), Nutrient net gain or loss, Forested lands, Dissolved nutrients, Mineral constituents, Forest productivity, Coastal plain watersheds, Nitrate nitrogen, Ammonium nitrogen, Orthophosphates.

Storm runoff from five reforested eroded watersheds in northern Mississippi (1.5 to 2.8 ha) was analyzed during the 1973 water year to determine the concentrations of soluble NO3-N, NH4-N, PO4-P, Ca, Mg, and K. Storm runoff was measured with 0.91-m H-flumes and samples collected with a Coshocton wheel sampler. Analysis of precipitation which totaled 189 cm for the year, 40% above average, revealed that inputs of NO3-N, NH4-N, PO4-P, Ca, Mg, and K for the year were 3.12, 5.73, 0.07, 7.72, 3.03, and 4.98 kg/ha, respectively. Soluble nutrient losses in the storm runoff on a unit area basis were similar for the five watersheds. Average losses in storm runoff of soluble NO3-N, NH4-N, PO4-P, Ca, Mg, and K for the year were 0.32, 3.35, 0.04, 6.21, 3.05, and 3.31 kg/ha, respectively. As the annual storm runoff among the watersheds increased, the NO3-N losses also increased linearly. Data for individual storms indicated that a critical storm runoff value must be exceeded before the watersheds would exhibit a net loss of each nutrient. (Henley-ISWS)

D FIBER BOARDS: RAW MATERIALS, BRATING CONDITIONS, WASTE WATER FIBERPLATER RASTOFF -- BRERINGSBETINGELSER -- AVLOP- N),
egian Pulp and Paper Research Inst., Oslo.
dland, and K. Helge.
Skogindustri, Vol. 30, No. 5, p 114-117, 1976. 12 fig, 3 ref. English summary.

Descriptors: *Waste water(Pollution), *Pulp waste, Europe, Foreign research, Pine trees, *Wood wastes, Biochemical oxygen demand, Hardwood, Softwood, Heat treatment, Time, Bark, Fibers(Plant), Pressure, Effluents.
Identifiers: *Fiberboards, *Norway, Spruce trees(Picea), Building boards, Fiber yield, *Defibration.

The Norwegian Paper Research Institute (PFI) in cooperation with Norsk Wallboard A/S. (Norway) has been investigating the effects of fiberizing conditions (8, 10, and 12 kp/sq cm pressure), pretreatments (3.5 to 7 min preheating times), and wood species (barked and unbarked spruce, unbarked pine, and hardwood slabs) on the fiber yield and the effluent BOD load in the production of pulp for building boards. A decrease in defibrator pressure from 12 to 8 kp/sq cm increased the fiber yield 4-5% for softwood and 6-7% for hardwood. Simultaneous shortening of preheating time increased yields 7-9%. Effluent BOD was clearly related to fiber yield. Hardwoods caused slightly greater BOD loads than did softwoods, but no significant differences were observed between spruce and pine or between bark and wood fibers, although bark contributes proportonately more to BOD because it reduces the fiberized yield. (Brown-IPC)

A SUMMARY OF RECEIVING WATER DISSOLVED OXYGEN CONDITIONS BELOW PULP AND PAPER MILL LOCATIONS,
National Council of the Paper Industry for Air and Stream Improvement, Inc., New York.
M. Iacoboni, and R. O. Blosser.
Special Report No. 76-03, 10 p, March, 1976. 1 tab.

Descriptors: *Dissolved oxygen, Natural streams, *Pulp wastes, Water pollution effects, Wastes, Industrial wastes, Water pollution sources, Water analysis, Streamflow, Water quality, Water pollution, Waste assimilative capacity, *Path of pollutant, Monitoring, Pollutant identification.

An analysis was made of dissolved oxygen data for 77 monitoring stations below 80 pulp and paper mills during the low-flow months in the years 1954, 1964, 1969, and 1974. There was a significant increase in dissolved oxygen level between 1969 and 1974. In 82% of the cases the dissolved oxygen met or exceeded the water quality standards in 1974. In the cases where the levels were significantly less than the standard, the mill effluent comprised all or the bulk of the stream flow. (Buchanan-IPC)

LARGE SCALE SYSTEMS APPROACH TO ESTUARINE WATER QUALITY MODELLING WITH MULTIPLE CONSTITUENTS,
Texas Univ. at Austin. Dept. of Electrical Engineering.
B. R. Penumalli, R. H. Flake, and E. G. Fruh.
Ecological Modelling (International Journal on Ecological Modelling and Engineering and Systems Ecology), Vol. 2, No. 2, p 101-115, June 1976. 6 fig, 4 tab, 11 ref, 1 append.

Descriptors: *Estuaries, *Water quality, *Mathematical models, *Simulation analysis, Nitrogen cycle, Ecosystems, Environment, Management, Equations, Systems analysis, *Texas, Bays, *Model studies, *Path of pollutants.
Identifiers: Matrix model, *Corpus Christi Bay(Texas), Concentration distribution, Steady state solution.

A matrix model for simulating concentration distributions of water quality constituents with coupled reactions in an estuary is developed from a large scale systems approach. The model is an approximation to the set of coupled partial differential equations describing the process. This steady state approximation is formulated as a large algebraic system consisting of coupled subsystems. The large algebraic system is solved by an efficient iterative method. Results utilizing actual field data are presented for the nitrogen cycle with five constituent forms of nitrogen for Corpus Christi Bay, Texas. Simulated and observed concentrations are compared. AN INTERDISCIPLINARY MATHEMATICAL MODEL APPLIED TO THE SOUTHERN BIGHT OF THE NORTH SEA,
Liege Univ. (Belgium). Institut de Mathematique.
J. C. J. Nihoul.
Ecological Modelling (International Journal on Ecological Modelling and Engineering and Systems Ecology), Vol. 2, No. 1, p 3-17, March 1976. 5 fig, 1 tab, 12 ref, 1 append.

Descriptors: *Ecosystems, *Mathematical models, *Management, *Simulation analysis, Food chain, Pollutants, Water quality, Fishing, Fish, Heavy metals, Storm surge, Tides, Coasts, Chemical analysis, Estuaries, Systems analysis.
Identifiers: *Marine ecosystem, *Southern Bight(Belgium), Prediction, Residual circulation model, Dispersion models, *Interdisciplinary model, Transfer functions, *North Sea(Southern Bight).

An interdisciplinary mathematical model based on a 5-year survey of the Southern Bight is presented; it is shown how, through a hierarchy of management-oriented submodels, a predictive description of the system can be given from tides, storm surges, residual circulation and dispersion mechanisms to the dynamics of ecosystems and the transfer of pollutants through the food chain. By providing estimates of the anticipated fish population and level of pollution, the model can assist Public Health decisions. The model can set up for management the problem of optimizing, subject to economical constraints, the tolerable inputs and the locations of sources of pollution, coastal outfalls and sea dumpings. The model integrates the contributions of more than a hundred research workers and technicians who collaborated with the Belgian National Environment Project during a 5-year period. (Bell-Cornell)

Identifiers: Eutrophication causes, *Kasumigaura Lake basin(Japan).

The water of Sakura River (R), Sakai R., Shinkawa R., Seimei R. and Hanamuro R. which flow into Tsuchiura bay of the lake Kasumigaura, was quantitatively analyzed from April 1971-April 1973 to determine the degradation of water quality of rivers relating to the eutrophication of the lake. Chemical oxygen demand (COD), NH4+, NO2-, Cl-, Zn++, Cd++ ions, dissolved oxygen (DO), coliform bacteria, etc., were analyzed together with electric conductance, temperature and pH. The pollution of Sakai R. was caused by industrial waste waters from metal product plants; Hanamuro R. by food product plants; and Shinkawa R. by urban sewage. The pollution of Sakura river was relatively lower. In the lake and the river with the wider drainage basin (Sakura R.) concentrations of COD and NH4+ ion increased in spring and summer and decreased in fall and winter. In rivers with narrow drainage basins near urban environments such a seasonal change of the water quality was not observed. In those rivers rainfall affected the water quality. The water quality was remarkably affected by the supply of irrigation water from the lake Kasumigaura in spring and summer. Irrigation water caused a decrease in bacterial numbers of Hanamuro and Sakura rivers.--Copyright 1975, Biological Abstracts, Inc.

Identifiers: *Marseille(France), *Bacteriological analysis.

Analysis of water samples taken from 4 locations near Marseille, France, in the Etange de Berre (Baie de Vaine, Baie de St. Chamas) and in the Mediterranean Sea near the Marseille Sewer at Cortiou is reported. The study was undertaken in order to view correlations between pollution as measured by bacteriological and chemical indicators, particularly in waters which are meant for swimming. Since chemical analysis is the faster of the 2 techniques, it would be possible to use these measures to quickly and precisely survey areas of possible pollution. Samples were taken (146 in total) and sent to a laboratory for bacteriological analysis and chemically analysed in a mobile laboratory at the sampling site. For the former, the number of coliform bacteria and escherichia coli were counted and for the latter detergent anions and ammonia were measured. Visual analysis of the figures obtained revealed that an attempt to correlate the figures mathematically would be statistically biased because of the form of the distributions. Each of the measures was divided into 3 sections: weak, medium and strong concentrations. This revealed interesting results. A first estimation is that for all samples where the concentration of detergents is greater than 350 micrograms per litre corresponds to water polluted by bacteria and all samples where the concentration of detergents were less than or equal to 300 micrograms per litre and ammonia was less than 100 micrograms per litre is non-polluted water. These definitions would permit a decision in perhaps two-thirds of all areas studied and the area of uncertainty could perhaps be narrowed with further study and other environmental and meteorological parameters could be taken into account. SOME OBSERVATIONS REGARDING PENTACHLOROPHENOL LEVELS IN HAVERFORD TOWNSHIP, PENNSYLVANIA,
Villanova Univ., Pa. Dept. of Chemistry.
J. E. Fountaine, P. B. Joshipura, and P. N. Keliher.
Water Research, Vol. 10, No. 3, 1976. p 185-188, 3 fig, 2 tab, 9 ref.

Descriptors: *Water pollution sources, *Sampling, *Water pollution control, *Phenols, *Pesticide residues, Toxins, Chemical analysis, *Pennsylvania, *Path of pollutants, *Pollutant identification, Herbicides, Insecticides.
Identifiers: *Naylor's Run Creek(Penn), *Pentachlorophenol, Haverford Township(Penn).

Pentachlorophenol (PCP) is used extensively as a herbicide, fungicide and insecticide, and with a worldwide production annually of more than 20,000 tons, it represents a possible toxic pollutant, even when concentrations reach levels as low as .2 parts per million. Naylor's Run Creek (PA) was analysed for this compound because of suspected pollution. Samples from the creek were analysed using several spectographic and chromographic techniques. Concentrations of PCP ranged from .1 to 10 ppm. They were highest near the stream source and near a factory and lowest downstream. Since PCP does not decompose readily, it must be either absorbed or diluted while it goes downstream. For one sample a bottle containing water from the stream was left to stand for two days after which samples were withdrawn from various levels in the bottle. It was found that the concentration dropped as depth in the bottle increased, so that it is possible that the PCP is slowly diffusing from the oil slick which is present in the stream and the bottle. From this and other analysis the rate of PCP discharge was estimated at about 13.3 grams per hour into the stream. Though it might seem easy to combat this pollution by closing the factory, a definite source of PCP, seepage of PCP from the ground would most likely continue. It would be possible to skim oil from the stream to reduce pollution or use a coagulation system. Decomposing bacteria and macroreticular resin bed would also help. (Smith-North Carolina)

NITROGEN AVAILABILITY IN URBAN RUNOFF,
Wisconsin Univ., Madison. Water Chemistry Program.
W. F. Cowen, K. Sirisinha, and G. F. Lee.
Journal Water Pollution Control Federation, Vol. 48, No. 2, p 339-345, February, 1976. 4 fig, 16 ref.

Descriptors: *Pollutant identification, *Analytical techniques, *Nitrogen, *Urban runoff, *Chemical reactions, Organic compounds, Ammonia, Nitrites, Nitrates, Bacteria.
Identifiers: Mineralization, Ammonia nitrogen, Nitrite nitrogen.

A series of mineralization tests were performed to study the reactions in which organic nitrogen is converted to ammonia nitrogen, which is converted to nitrite nitrogen, which is converted to nitrate nitrogen in urban runoff under the influence of the bacteria in the runoff. Grab samples of urban runoff were collected from street gutters and open storm sewers in a low density residential area, a medium density area, and a university campus in Madison, Wisconsin. The samples were chemically analyzed for ammonia nitrogen, nitrate nitrogen, total Kjeldahl nitrogen (TKN), and soluble Kjeldahl nitrogen (SKN). Nitrite nitrogen concentrations were assumed to be negligible. Runoff samples were then incubated in darkness for 82 to 100 days at 21 C and analyzed for ammonia nitrogen and nitrate nitrogen at intervals. The concentration of algal-available nitrogen was computed and the TKN and SKN values determined. The mineralized waters contained from 57% to 82% of total nitrogen as algal-available nitrogen, with an average of 70%. Since algal-available nitrogen in the fresh runoff samples ranged from 4 to 66% of total nitrogen, the influence of bacterial mineralization on the release of inorganic nitrogen from the runoff to the waters receiving the runoff is readily apparent. Gross underestimates of available total nitrogen could result if only the inorganic nitrogen data from chemical analyses of fresh runoff are considered. The mineralization of organic nitrogen forms should be considered in any estimates of the true, biologically important nitrogen loadings from urban runoff. (Snyder-FIRL)

Effects Of Pollution

EFFECTS OF CADMIUM ON FRESH- ER PHYTOPLANKTON,
ont Univ., Burlington. Dept. of Biochemis-

Hart, and P. W. Cook.
able from the National Technical Informa- Service, Springfield, VA 22161 as PB-257 547, in paper copy, $3.00 in microfiche. Vermont r Resources Research Center, Burlington, letion Report, July 1975, 106 p. OWRT A-t(1).

iptors: *Cadmium, Heavy metals, Lakes, oplankton, Plankton, Plant growth, Acidity, chains, Inhibition, Photosynthesis, Carbon le, Oxygen, Water pollution effects.

ts were determined of cadmium on selected s of freshwater algae, including strains iso- from the plankton. Total growth of mixed plankton cultures exposed for 8 days to 0.50 Cd was 25% of control cultures. Certain ns, flagellates, and blue-green algae appeared to be most sensitive to Cd whereas 2 genera of diatoms (Nitzschia and Flagilaria) and green algae such as Chlorella were relatively resistant. The results indicate that: (1) natural phytoplankton are sensitive to Cd present in the water in which they are growing; (2) Cd has a selective effect upon different species within a heterogeneous population; (3) a similar selective effect can also be demonstrated with uni-algal cultures exposed to Cd; (4) resistant algal strains can concentrate as much as 500-fold greater concentrations than present originally in the growth medium and thus could pose a potential hazard to the food-chain; (5) the extent to which Cd is accumulated is a function of the acidity and the electrolyte composition of the aquatic environment; (6) cultures grown in non-lethal concentrations of Cd have reduced ability to carry out the photosynthetic activities of oxygen evolution and carbon dioxide fixation; (7) the degree of inhibition of CO2 fixation and O2 evolution is directly related to the sensitivity of the organism to cadmium.

Identifiers: *Crystal River(Fla), Coal pile runoff water, Diversity indexes.

Hydrographic and biological data collected during the first 6 mo. of 1971 are presented. These, plus 1969 and 1970 data, complete an ecological survey of estuarine and coastal areas near Florida Power Corporation's Crystal River, Florida, steam electric generating station. This base line information should be compared with data collected after a nuclear generator becomes operational (mid-1974 or later). Discharge canal temperature was directly related to electricalpower output, with 2 daily peaks and a notable decrease from the late night to early morning. A wide range of salnities occurred in the study area. Trace metal levels from oysters near the power plant are also presented. Highest Cu levels were recorded in April 1971 (63.0 ppm) and Oct. 1969 (80.0 ppm). Correlatives may include spawning activity, increased metabolic rates, and Cu ions in coal pile runoff water. Distribution of benthic algae and invertebrates was similar to that previously reported. An annotated checklist of fishes collected during the 2 1/2 yr study is appended. Based on some 33,000 specimens (53 families), the list includes 95 identified species plus 9 either grouped together or identified to genus only. Diversity indices (S-1/LeN) were calculated from 1971 fish data and comparable periods in 1969 and 1970. The patterns of values for stations nearer river influence differed from the pattern at more remote stations.--Copyright 1973, Biological Abstracts, Inc.

POTENTIAL EFFECTS OF FOREST MANAGEMENT PRACTICES ON STORMFLOW SOURCES AND WATER QUALITY,
Forest Service (USDA), Oxford, Miss. Southern Forest Experiment Station.
R. S. Beasley.
In: Proceedings, Mississippi Water Resources Conference 1976, p. 111-117. 1976. 34 refs. Water Resources Research Institute, Mississippi State University.

Descriptors: *Subsurface flow, *Sewage disposal, *Sediment yield, Water quality, *Soil water movement, Overland flow, Erosion, Forest management, *Mississippi, Coastal Plains, Limbering, Sites, Land use, Planning, Forest management, Storm runoff.

Disturbances from clearcut logging, intensive site preparation, and sewage disposal on forest lands may alter the normal flow processes and impair water quality. Especially vulnerable are stormflow source areas and sites subject to rapid subsurface flows. Skid trails are the primary source of sediment from logging; but increased water yields after cover removal expand source areas, increase overland flows, and initiate sheet and rill erosion. Litter decomposition after clearcutting exposes mineral soil and promotes surface sealing which reduces infiltration and increases overland flow and sediment yield. Increased flow through macrochannels may accelerate erosion within the openings and increase sediment delivery to streams even in the absence of surface erosion. Intensive site preparation often removes all vegetation and most of the forest floor, compacts the soil surface, and seals macrochannel openings, thereby altering the normal flow processes. Sewage effluent disposed on source areas and sites with rapid subsurface flows may pass unaltered through macrochannels or overland to stream channels, posing serious pollution problems. The key to minimizing hydrologic impacts of forest management is to categorize each site according to its suitability for specific treatments, recognizing the variable rather than fixed nature of stormflow source areas. SUB-LETHAL EFFECTS OF CHLORINATED HYDROCARBONS ON BIVALVES,
Queen's Univ., Belfast (Northern Ireland). Dept. of Zoology.
P. Roberts.
Marine Pollution Bulletin, Vol. 6(2), 1975, pp. 20-24, 1 tab., 5 fig., 14 ref.

Descriptors: *Animal behavior, *Benthic organisms, *Clams, *Toxicity, Animal physiology, *Respiration, *Chlorinated hydrocarbon pesticides, Physiology, Behavior, Mollusks, *DDT, *Polychlorinated biphenyls, *Dieldrin, *Endrin, Environmental effects, Mussels.
Identifiers: *Endosulfan, Oxygen consumption(Bivalves), Heart beat, Mya arenaria, Pecten maximus, Mytilus edulis, HEOD, Sub-lethal effects.

Chlorinated hydrocarbon pesticides are present in low concentration in most waters. While generally

not causing direct mortality so far as is known, they may well have sub-lethal effects, reducing the health and viability of marine organisms. In this study the effect of Endosulfan, endrin, DDT and dieldrin on respiration, heart beat and burrowing of some marine bivalves has been examined. The tests included in this study broaden the scope of toxicity testing using bivalves and illustrate a range of potential tests by which pollutant toxicity might be gauged. (Katz)

THE TROPHIC STATE OF NORTH CAROLINA LAKES,
North Carolina Univ. at Chapel Hill. Dept. of Environmental Sciences and Engineering.
C. M. Weiss, and E. J. Kuenzler.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-257 491, $10.50 in paper copy, $3.00 in microfiche. North Carolina Water Resources Research Institute, Raleigh, UNC-WRRI Rpt. No. 119, July 1976. 224 p, 1 fig., 63 tab, 62 ref, 2 append. OWRT A-078-NC(2), 14-31-0001-5033.

Descriptors: *Trophic level, *Eutrophication, *Mesotrophy, *Oligotrophy, *Lakes, Reservoirs, Water quality, Conductivity, Nutrients, Phosphorous, *North Carolina, Impoundments, Water pollution effects, Phytoplankton, Secchi disk, Monitoring.
Identifiers: *Pollution index, *Trophic scale.

Water quality data assembled over the period 1971-1975 from the lakes and impoundments of North Carolina constituted a data pool of 854 observations that were used to describe their trophic state. Each of the 854 observation was considered a microcosm and was described in terms of its physical and chemical environment and the contained microflora (phytoplankton). By means of computerized sorting procedures and examination of known and implied relationships of more than 20 variables for each observation it was determined that total phosphorus, conductivity, and the pollution index had the most consistent and strongest correlations with measure of trophic state. Utilizing these, plus Secchi disk depth, a six-step trophic scale was defined for North Carolina waters ranging from oligotrophic to hypereutrophic. A total of 69 lakes, reservoirs, or subsegments of reservoirs were accordingly classified: 8 oligotrophic; 15 oligo-mesotrophic; 24 mesotrophic 17 alpha-eutrophic; 3 beta-eutrophic; and 2 hypereutrophic. Relating this six-step trophic scale to the mean depth of 41 of these bodies of water revealed a strong and significant negative correlation that identified a mean depth of 15-20 ft. as being a critical value for waters of high quality, low on the trophic scale. It is recommended that trophic state monitoring in North Carolina be based upon the variable total phosphorus, conductivity and Secchi disk transparency. (Stewart-North Carolina State)

A LIMNOLOGICAL STUDY OF SPIRITWOOD LAKE, N. D., WITH SPECIAL EMPHASIS ON ITS WATER QUALITY, SEASONAL CYCLES OF CHEMICAL NUTRIENTS, PHYTOPLANKTON, ZOOPLANKTON AND PRIMARY PRODUCTION, PART I: PHOTOSYNTHETIC PRODUCTION AND ENERGY CONVERSION IN SPIRITWOOD LAKE, NORTH DAKOTA,
North Dakota State Univ., Fargo. Dept. of Zoology.
G. W. Comita, and E. G. Wolf.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-257 734, $3.50 in paper copy, $3.00 in microfiche. North Dakota Water Resources Research Institute, Fargo, Research Report, No. WI-222-006-75, March 1975. 10 p, 6 fig, 4 tab. OWRT B-001-NDAK(3). 14-01-0001-882.

Descriptors: *Phytoplankton, Solar radiation, *Primary productivity, *North Dakota, *Photosynthesis, *Energy conversion, Lakes, Water pollution effects.
Identifiers: Spiritwood Lake(ND).

Gross integral production in Spiritwood Lake, North Dakota, measured by the light and dark bottle method from June 6 to September 7, 1966, was 111.1 cal per sq. cm for a solar radiation energy conversion efficiency of 0.36 per cwt. Estimates for the entire year yielded 159.2 cal per sq. cm and an efficiency of 0.19 per cwt. Integral phytoplankton respiration (June 6 through September 7) was 23.6 cal per sq. cm or 21.2 percent of integral gross production, from which a P-to-R ratio of 5.03 was calculated. Integral net phytoplankton production for the summer was 87.5 cal per sq. cm for an efficiency of 0.28 percent. This value for the entire year (8.3 months) was 121.3 cal per sq. cm or 0.20 percent of the available incident solar radiation. (See also W76-12214)

A LIMNOLOGICAL STUDY OF SPIRITWOOD LAKE, N. D., WITH SPECIAL EMPHASIS ON ITS WATER QUALITY, SEASONAL CYCLES OF CHEMICAL NUTRIENTS PHYTOPLANKTON, ZOOPLANKTON AND PRIMARY PRODUCTION, PART II: CAUSES AND CONTROL OF ALGAL BLOOMS IN SPIRITWOOD LAKE, NORTH DAKOTA,
North Dakota State Univ., Fargo. Dept. of Zoology.
J. J. Peterka, and J. W. Held.
Available from the National Technical Information Service, Springfield, Va 22161, as PB-257 735, $3.50 in paper copy, $3.00 in microfiche. North Dakota Water Resources Research Institute, Fargo, Research Report, No. WI222-006-75, March 1975, 18 p, 3 fig, 3 tab, 17 ref. OWRT-B-001-NDAK(3). 14-01-0001-882.

Descriptors: *Eutrophication, Nutrients, *North Dakota, Lakes, *Nitrogen, *Phosphorus, Estimating, Water pollution sources, Water pollution effects, *Algal control, Algicides.
Identifiers: *Spiritwood Lake(ND), Cutrine, Hydrothol.

Sources and possible means of control of algal blooms in Spiritwood Lake, a popular recreational lake, were investigated during the summer of 1970. The objective was to provide a preliminary estimate of sources of nitrogen and phosphorus and to recommend necessary research approaches toward solving eutrophication problems of the lake. Of the estimated nitrogen and phosphorus entering the lake during spring runoff, 62 percent of the nitrogen and 95 percent of the phosphorus appeared to come from diffuse land surface sources, such as drainage from fields and grasslands. Nitrogen, and to a lesser degree phosphorus, in livestock excrement are potentially important contributors to nutrient enrichment. Field experiments indicated that additions of inorganic nitrogen increased algal production whereas phosphorus inhibited it. (See also W76-12213)

Identifiers: *Outer Continental Shelf, *New York Bight, Ocean dumping, Antibiotics, Environmental impact.

The Marine EcoSystems Analysis (MESA) Project of NOAA was initiated in 1973 to assess the impacts of man's activities and the natural influences on the New York Bight. Several examples of contaminant impacts on marine resources have been identified rather quickly: (1) high prevalence of diseases in several species of finfish and shellfish; (2) major alterations in the distribution and abundance of bottom living organisms; (3) widespread distribution in exceptionally high numbers of coliform and fecal coliform bacteria, indicative of pathogenic bacteria (which findings have led to closure of clam fishing operations in extensive areas around and landward of ocean dumping sites); (4) presence of transfer-resistant (R+) bacteria which are resistant to broad spectra of heavy metals and antibiotics; and (5) noxious concentrations of suspended particulate material, flotsam and surface slicks, particularly on beaches used very intensively for bathing and sportfishing. hloris sp., *Cesium radioisotopes.

ion growth and concentration factors for
nd 137Cs were measured for Achnanthes
s, Carteria sp., Chlamydomonas sp., Dul-
salina, Nannochloris atomus, and
actylum tricornutum subjected to factorial
ations of eight temperatures (6-40 C) and
nities (3.4-44.0 p.p.t.). Regression coeffi-
were calculated for polynomial models
ng response surfaces for growth and
clide concentration. Salinity was more im-
than temperature in describing population growth for Carteria, Dunaliella, Nannochloris and Phaeodactylum. Temperature accounted for more variation in 65Zn concentration factors than salinity or population growth in all algae Dunaliella. Concentration factors for 65Zn were uniformly higher than 137Cs concentration factors. (Katz)

HYGIENIC AND TOXICOLOGICAL EVALUATION OF SOME GRADES OF RUBBER USED IN DOMESTIC WATER SUPPLY SYSTEMS, (IN RUSSIAN),
Municipal Sanitary-Epidemiological Center, Moscow (USSR).
G. L. Sardarova.
Gig Sanit. 4, p 103-104, 1974.

Descriptors: Toxicity, Public health, Rubber, Domestic water, Water supply, Corrosion control, Protective coating, Organoleptic properties, Rodents.
Identifiers: Aldolase, Blood, Liver.

Results of a hygienic and toxicological evaluation of rubbers Nos. 1976, 2566 and 1751 used for anticorrosive coatings are presented. The investigation showed the possibility of using rubbers Nos. 1751 and 1976 as anticorrosive coatings on water lines and that rubber No. 2566 cannot be used, since it has an unfavorable effect on the organoleptic properties of water. In a 5-mo. experiment in which rats received daily a 3-day infusion of water on the investigated rubber specimens as drinking water, no significant changes were noted in the condition of the animals, their weight, condition of the peripheral blood, blood coagulation, liver function, content of blood metHb and activity aldolase. --Copyright 1975, Biological Abstracts, Inc.

EFFECT OF LINDANE ON TROUT FRY (SALMO IRIDEUS GIBB.) CHANGES IN GLYCOLYTIC ENZYMES, (IN FRENCH),
Paris-7 Univ. (France). Lab. of Comparative Anatomy.
H. Boulekbache, and C. Spiess.
Bull Soc Zool Fr. 99(1), p 79-85, 1974.

Descriptors: *Trout, *Insecticides, *Fry, *Growth stages, *Metabolism, Carbohydrates, Water pollution effects, Enzymes.
Identifiers: Aldolase, Dehydrogenase, Kinase, Lactate, *Lindane, Liver, Muscle.

S. irideus fry is highly sensitive to lindane (an insecticide) treatment, the sensitivity increasing with the stage of development from hatching to yolk-sac resorption. The effect is revealed by marked changes in the histological structure of the liver and muscle as in the levels of the glycolytic enzymes: lactic-dehydrogenase (LDH), pyruvate kinase, aldolase as well as phosphoglucomutase. The decrease in LDH activity is especially noted. A modification in carbohydrate metabolism of trout fry when exposed to lindane is possible. --Copyright 1975, Biological Abstracts, Inc.

STUDIES ON OIL POLLUTION AND SEABIRDS IN DENMARK 1968-1971,
Game Biology Station, Ronde (Denmark).
A. H. Joensen.
Dan Rev Game Biol. 6(9), p 1-32, 1972.

Descriptors: *Oil pollution, *Oil spills, Water pollution effects, *Birds, Waterfowl, *Ducks(Wild), Mortality.
Identifiers: *Denmark, *Seabirds, Seaducks.

The purpose of the studies on oil pollution was 2-fold: firstly, to examine the extent of oil pollution and obtain as good an estimate as possible of the number of birds killed, and secondly, by examination of the dead birds, to obtain information on the age and sex-composition of the seaduck populations. The results of studies made during July 1968-June 1971 are given. In addition to general recording of cases of oil pollution, detailed studies were made of 5 large disasters. The maintenance of a rich fauna of seabirds, and especially seaducks, not only in Denmark but the whole of Western Europe, requires measures in Danish waters against the minor cases of pollution now occurring, such that their future extent is decreased.--Copyright 1975, Biological Abstracts, Inc.

A RED BLOOM IN HORN SO NEAR LEMVIG (N. W. JUTLAND), CAUSED BY THE DINOFLAGELLATE OXYRHIS MARINA, (IN DANISH),
Copenhagen Univ. (Denmark). Inst. of Plant Anatomy and Cytology.
J. Kristiansen.
Flora Fauna. 80(3), p 65-69, 1974.

Descriptors: *Dinoflagellates, Lakes, Europe, *Eels, *Ecological distribution, Fishkills, Oxygen, Water pollution effects, Toxicity, Toxins.
Identifiers: Jutland, Lemvig, *Oxyrrhis-marina, *Red bloom(Lakes), *Horn So(Denmark).

On Sept. 24, 1973, it was observed that the water of Horn So, a small lake near Lenvig (N. W. Jutland), was colored intensely red. At the same time 200 kg of eels kept in tanks in the lake were killed. The lake is connected with the Limfjord and has a salinity of about 24 0/00. The red color was due to a mass development (about 300,000 cells/ml) of the apochlorotic dinoflagellate O. marina Duj. This organism is described, and details of its distribution and ecology are discussed. The fish kill is supposed to have been caused by Oxyrrhis, but it could not be decided whether toxic substances produced by this organism or oxygen deficiency were responsible. References are made to similar blooms of other dinoflagellates, but blooms of Oxyrrhis, causing fish kills, have apparently not been recorded previously.--Copyright 1975, Biological Abstracts, Inc.

SPECIFIC FEATURES OF PHYTOPLANKTON IN THE LOWER COURSE OF THE IRTYSH RIVER, (IN RUSSIAN),
Tyumenskii Gosudarstvennyi Meditsinskii Institut (USSR).
E. I. Yurova.
Izv Sib Otd Akad Nauk SSSR Ser Biol Nauk. 1, p 133-135, 1974.

Descriptors: *Phytoplankton, *Systematics, *Algae, *Cyanophyta, Effluents, Rivers, *Eutrophication, Water pollution effects.
Identifiers: Asterionella-formosa, Cyanarcus-hamiformis, Fragilaria-crotonensis, Melosira-distans-var-alpigena, Melosira-granulata-var-granulata, Melosira-islandica-F-islandica, Microcystis, Scenedesmus, Tetracus-ilsteri, *USSR(Irtysh River).

During years of research 297 water-plant taxa were registered in the lower course. Only 112 forms are common of the middle and lower course. Double species structure enrichment of the leading groups of algae is registered near the river-mouth. Prevalent forms of the low Irtish (USSR) biocenoses are Melosira granulata (Ehr.) Ralfs var. granulata, Fragilaria crotonensis Kitt. Asterionella formosa Hass. A variety of Scenedesmus and Microcystis species is presented. A series of genera new to Irtish is given in this article including Melosira islandica O. Mull. f. islandica, M. distans (Ehr.) Kutz. var. alpigena etc. Uncommon water-plants have been registered such as Tetracus ilsteri Skuja, Cyanarcus hamiform is Pasch. The conclusion concerns the influence of flood-lands reservoir effluents promoting the enrichment of the phytoplankton of Low Irtish. Sometimes blue-green algae play an important part.--Copyright 1975, Biological Abstracts, Inc.
W76-12267

SUCCESSION OF PLANKTON DIATOMS IN TOKYO BAY, (IN JAPANESE),
Tokyo Univ. (Japan). Ocean Research Inst.
R. Marumo, and M. Murano.
Mer (Tokyo). 11(2), p 70-82, 1973.

Descriptors: *Succession, *Planktons, *Diatoms, Bays, Cyanophyta, Algae, Copepods, Crustaceans, Asia, Standing crops, *Eutrophication, Red tide, Distribution, Water pollution effects, *Dinoflagellates, Primary productivity.
Identifiers: Chaetoceros-affinis, Chaetoceros-debilis, Chaetoceros-decipiens, Chaetoceros-socialis, Chaetognaths, Coscinodiscus, Ditylum-brightwellii, Diversity, Eucampia-zoodiacus, Eutrophication, Nitzschia-seriata, Rhizosolenia-setigera, Skeletonema-costatum, Thalassionema-nitzschioides, Thalassiosira, *Tokyo Bay(Japan).

The succession of plankton diatoms in Tokyo Bay (Japan) was studied, on the basis of the investigations carried out in 1947, 1966-68 and 1972-73. The species number was smaller in the bay than in Uraga Channel as to diatoms as well as blue-green algae, dinoflagellates, copepods, cladocera and chaetognaths. Recently, any oceanic species of these taxonomic groups have not been found in the inner part of the bay. The number of diatom species in the inner part of the bay was 35 in 1947, 28 in 1966-68 and 23 in 1972-73. Oceanic diatoms amounted to 12 spp. in 1947, but they disappeared in the latter 2 periods. Dominant diatoms in the bay were Chaetoceros affinis, C. decipiens, Rhizosolenia setigera, Skeletonema costatum, Nitzschia seriata and Thalassionema nitzschioides in 1947 and Chaetoceros debilis, C. socialis Coscinodiscus spp. Thalassiosira spp., Eucampia zoodiacus, Ditylum brightwellii, Rhizosolenia setigera Skeletonema costatum and Nitzschia seriata in 1966-68 and 1972-73. The diatom community in 1927 was somewhat different from that in 1947, but oceanic diatoms were distributed in both these years. The frequent occurrence of diatom red tides since the 1950's suggests that the diatom standing crop had remarkably increased in the bay in recent years. S. costatum had been the most important species as a red tide organism as well as in the standing crop in usual distribution in the bay from 1947 on, Judging from the succession of the standing crop and species number of diatoms, water of Tokyo Bay was eutrophic in 1947 and extremely eutrophic in recent years. It may possibly become even polysaprobic, if the eutrophication and the pollution will be accelerated from now on.--Copyright 1975, Biological Abstracts, Inc.

THE INFLUENCE OF GRASS-CARP POPULATION (CTENOPHARYNGODON IDELLA VAL.) ON THE VEGETATION AND ECOSYSTEM OF LAKE TRAKOSCAN, (IN SERBO-CROATIAN),
Zagreb Univ. (Yugoslavia). Institut za Biologijo.
M. Mestrov, L. Ilijanic, V. Tavcar, and J. Koprek.
Acta Bot Croat. 32, p 125-134, 1973.

Descriptors: *Dissolved oxygen, *Mud, Lakes, Europe, Organic matter, Sedimentation, Organic matter, *Carp, Respiration, Ecosystems, Microorganisms, Phytoplankton, Zooplankton.
Identifiers: Ctenopharyngodon-Idella, Grass Carp, *Lake Trakoscan(Yugoslavia).

The lake is choked by mud so that the mud content rises to 37% of total volume. The main cause of muddiness is an alluviation of deposited mineral material. Abundant macrovegetation supports the sedimentation of inorganic and organic matter and causes a rise of the bottom. A large quantity of anaerobic microorganisms in the mud made anaerobic respiration possible over a great part of the lake. Decline in the quantity of dissolved O2 was noted every summer. Characteristic of the lake is its betamezosaprobity especially toward the bottom (alphamezosaprobity). The radical decrease in macrovegetation in 1971 caused by the grass-carp, resulted in essential alteration of physicochemical features of the water as well as in quantitative and qualitative changes in the plankton community. The disappearance of the dominant kinds of macrovegetation caused the elimination of the main consumer of CO2, followed by vigorous augmentation of dissolved carbon dioxide. In 1971 particularly in Aug., a decline was noticed in the quantity of dissolved O2. Strong fluctuations in the quantitative composition of zoo- and phytoplankton in 1971 indicate a disordered balance in the ecosystem caused by the planted fish. Recovery will require the cleaning of the lake by removing the mud and the construction of a sedimentary storage pond. The planting of grass-carp or other kinds of fish should be done cautiously and its effect will have to be controlled.--Copyright 1975, Biological Abstracts, Inc.

DISCOVERY OF LIGULA INTESTINALIS (GOEZE 1782) GMELIN, 1790 IN LERMICHTHYS MULTIRADIATUS (MEEK) (PISCES: GOODEIDAE), (IN SPANISH),
Universidad Nacional Autonoma de Mexico, Mexico City. Instituto de Biologia.
R. Lamothe-Argumedo, and A. Cruzreyes
Rev Soc Mex Hist Nat. 33, p 99-106, 1972.

Descriptors: *Mexico, Freshwater fish, Marshes, *Fish diseases, *Pathology, Mortality, Larvae, Epizoology.
Identifiers: Goodeidae, *Lermichthys-Multiradiatus, *Ligula-Intestinalis, Pisces, Cestodes.

The larva of Ligula intestinalis reported from Mexico for the 2nd time was found in the celom of Lermichthys multiradiatus, a freshwater fish captured in the Lerma marshes, Mexico. Larval Ligulidae are pathogenic to fish, especially to those of this small species; for besides the expoliative action characteristic of the cestodes, they displace the fish's viscera, producing serious complications which result in death, and thus may cause epizootics of considerable economic importance.--Copyright 1975, Biological Abstracts, Inc.

ON ENVIRONMENTAL FACTORS OF EEL POOLS: I. CHEMISTRY OF THE WATER AND SOIL AND PLANKTON IN OCTOBER 1965 AND JULY 1966, (IN JAPANESE),
Freshwater Fisheries Research Lab., Tokyo (Japan).
J. Toi, T. Ito, and Y. Satomi.
Bull Freshwater Fish Res Lab Tokyo. 21(1), p 1-13, 1971.

Descriptors: *Eels, Water chemistry, Plankton, *Soil chemistry, Anabaena, *Nitrogen compounds, Oxygen, Scenedesmus, *Environmental effects, Ponds, *Phosphorus, Compounds, *Phytoplankton, Zooplankton.
Identifiers: Microcystis.

Chemical and biological studies of water and soil in eel pools showed that dry fodder did not severely influence ecological conditions at least immediately after feeding. Under feeding conditions pH values and O2 values decreased in the early morning. O2 content varied from 0 to several hundred percent oversaturation. Concentrations of organically dissolved N compounds varies widely throughout the day. Organically dissolved P compounds show no essential changes. In the early morning Eh7 values of the water are dependent on O2 saturation. In pools where phytoplankton died due to a lack of nutrient salts the predominant phytoplankton species are not stable. Both organic N and P compound content correlates well with heat loss. When acid pool soils are neutralized by addition of lime, the predominant zooplankton species change. The ratio of particulate N/P is greater in the Microcystis eel pools than in the Scendesmus pools. The content of N compounds is lower in the Anabaena pools than in the Microcystis pools.--Copyright 1975, Biological Abstracts, Inc.

THE EFFECT OF DOMESTIC WASTE WATER ON THE DISTRIBUTION OF GAMMARUS PULEX L. AND GAMMARUS FOSSARUM KOCH IN A SUB-ALPINE MOUNTAIN STREAM IN HESSEN, (IN GERMAN),
Max-Planck-Institut Fuer Limnologie, Schlitz (West Germany). Limnologische Flussstation.
M. P. D. Meijering, A. G. L. Hagemann, and H. E. F. Schroeer.
Limnologica. 9(2), p 247-260, 1974.

Descriptors: *Domestic wastes, *Distribution, *Streams, Europe, Mortality, *Water temperature, Water purification, Seasonal, *Turbulence.
Identifiers: *Gammarus-fossarum, *Gammarus-pulex, *West German(E. Hessen).

The unpolluted streams of E Hessen (West Germany) are populated by G. fossarum along most of their length but G. pulex is concentrated mainly at the sources and lower courses due to temperature and turbulence. The slough system contained a small amount of G. pulex in a G. fossarum population which reached a maximum in autumn and almost disappeared in winter but never entirely. After purification of the water, only G. pulex reappeared in the lower course. When transferred to highly polluted water, G. pulex had the same pollution resistance in every season but its mortality rate was highest in heavily polluted water during summer. The same was true of G. fossarum but its populations diminished even faster.--Copyright 1975, Biological Abstracts, Inc.

STUDIES OF MINERAL PHOSPHATE CONSUMPTION BY A TROPICAL WATER PLANKTONIC COMMUNITY, (IN RUSSIAN),
Akademiya Nauk SSSR, Moscow. Institut Biologii Vnutrennykh Vod.
Yu. I. Sorokin, and D. E. Vyshkvartsev.
Okeanologiya. 14(4), p 688-692, 1974.

Descriptors: *Phosphates, Phytoplankton, Plankton, *Pacific Ocean, Tropics, *Absorption, Bacteria.
Identifiers: *Mineral phosphate.

The intensity of phosphate consumption by a planktonic (including phytoplankton) community of the tropical waters of the SW Pacific was analyzed with the aid of P32. The rates of phosphate consumption (per day) were: 0.4 micrograms P/1 in the region of weak divergence, 0.1-0.3 micrograms P/1 in the region of convergence and 1-2 micrograms P/1 in the shallow waters. The turnover time of phosphate P in the surface waters was significant (100-200 h). In accordance with the size distribution of microplankton, a large part of phosphate is consumed by bacteria.--Copyright 1975, Biological Abstracts, Inc.

Descriptors: *Bacteria, Lakes, Trophic level, *Filtration, *Absorption, Plankton, Reproduction, Water pollution.
Identifiers: *Bacterioplankton, Phials.

Experiments with filtered water from lakes of different trophic character showed that water filtration changes the habitat bacteria: regular change in their morphological composition and 'pulsation' of heterotrophic assimulation take place. The Razumov-Ivanov method for determining bacterioplankton generation times gives no indication of bacterial reproduction rates in the water body since in the filtered water this rate does not remain constant for a long time.--Copyright 1975, Biological Abstracts, Inc.

DESTRUCTION OF ORGANIC MATTER IN GROUNDS OF KAPCHAGAI RESERVOIR, (IN RUSSIAN),
Akademiya Nauk Kazakhskoi SSR, Alma-Ata. Inst. of Microbiology and Virology.
N. K. Gulaya, and N. L. Tyuten'kova.
Mikrobiologiya. 43(2), p 316-320, 1974.

Descriptors: *Organic matter, Reservoirs, Phytoplankton, *Decomposing organic matter, Aerobic conditions, Anaerobic conditions.
Identifiers: *Kapchagai Reservoir(USSR).

The rate of destruction of organic matter was determined in soils of the Kapchagai Reservoir (USSR) during the 3rd year of its filling (May, July and Oct. of 1972). Aerobic decomposition of organic matter per day was 329 mg C/m2 in spring, 280 mg C/m2 in summer and 206 mg C/m2 in autumn. Anaerobic destruction of organic matter per day was 38% in spring, 62% in summer and 48.8% in autumn, of the total amount of mineralized organic matter. (Phytoplankton are mentioned.)--Copyright 1975, Biological Abstracts, Inc.

THE MERCURY CONCENTRATION IN EELS (ANGUILLA ANGUILLA) FROM THE ESTUARY OF THE GUADALQUIVIR RIVER AND 'ESTEROS' OF SALINES OF CADIZ BAY, (IN SPANISH),
Instituto de Investigaciones Pesqueras, Dadiz (Spain). Laboratorio de Investigaciones Pesqueras.
R. Establier.
Invest Pesq. 39(1), p 249-156, 1975.

Descriptors: *Mercury, *Eels, Estuaries, Europe, Bays, Rivers, Sediments, Salinity.
Identifiers: Anguilla-Anguilla, Esteros, Guadalquivir River(Spain), Mugil-Auratus, Mugil-Cephalus, *Bay of Cadiz(Spain).

The average concentration of total Hg (expressed on a wet weight basis) of eels from the estuary of the Guadalquivir River and from 'Esteros' of Salines from Cadiz Bay (Spain) was 0.27 ppm and 0.19 ppm, respectively. The levels of Hg in mullet (Mugil cephalus and M. aurata) were below 0.12 ppm. Concentration of Hg in sediment from Salines of Cadiz Bay was 0.12-0.18 ppm.--Copyright 1975, Biological Abstracts, Inc.

SOME ASPECTS OF FOAM AND SCUM MYCOFLORA IN THE RUNNING WATERS OF POLESYE AND STEPPE OF THE UKRAINIAN SSR, (IN UKRANIAN),
Akademiya Nauk URSR, Kiev. Instytut Botaniki.
I. O. Dudka, and N. O. Moshkova.
Ukr Bot Zh. 31(6), p 723-727, 1974.

Descriptors: *Foaming, *Fungi, Rivers, Streams, Forests.
Identifiers: *Polesye(USSR), Scum, Steppe, Ukrainian-SSR, *Micoflora, *Fungal spores.

Comparison between the complexes of fungal spores found in foam and scum of the running waters in Polesye and steppe of the Ukrainian SSR (USSR) and those found in the surface biotope of the running waters in forest-steppe and the Carpathians showed that the former differ in having less specific variety and fewer spores. The poorest specific composition and the fewest fungal spores are observed in the surface biotope of the steppe running waters. In the foam and scum of the steppe rivers and streams the spores of ground fungi were an essential quantitative component of the fungal complex, while in the surface biotope of the running waters in other botanicogeographical zones of the Ukrainian SSR the total quantitative content of the fungal spores was determined by the quantity of aquatic hyphomycetous conidia. The hydrological and hydrochemical factors affecting the formation of fungal spore complexes in neuston associations in the Polesye and steppe running waters are also discussed.--Copyright 1975, Biological Abstracts, Inc.

DEVELOPMENT OF CERTAIN BLACK SEA FISHES IN SEA CONTAMINATED BY PETROLEUM PRODUCTS,
O. G. Mironov.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-237 904T, $3.50 in paper copy, $3.00 in microfiche. EPA Translation EPA-TR-31-75. September 1974, 9 p, 2 tab, 3 fig, 4 ref. Source publication not given.

Descriptors: *Marine fish, *Fish physiology, *Fish eggs, *Oily water, *Toxicity, *Bioassay, *Reproduction, Fry, Water pollution effects, Oil pollution, Oil spills, Zooplankton, Growth rates, Growth stages.
Identifiers: Engraulis enrasicholus, Scorpaena porcus, Crenilabrus tinca, *Black Sea.

A study was made of the development of the fertilized eggs of Engraulis enrasicholus ponticus Alex., Scorpaena porcus L., and Crenilabrus tinca L. in sea water containing 0.1-0.01 ml/liter petroleum, solar oil, and mazut. The different species sensitivity of the fishes to the petroleum products used was found. The damaging effect of these compounds (death of the organisms) was clearly indicated down to a concentration of 0.001 ml/liter. Lower concentrations of petroleum, solar oil, and mazut were also proved toxic for the hydrocarbionts. The consequences of this intoxication can be reflected not in the direct death of the roe or prelarvae, but in the later stages of development or in future generations. (Katz)

EFFECTS OF A WASTE OF 'PAPER KRAFT' ON THE BENTHIC ALGAL POPULATIONS IN N.W. SPAIN. 'STRESS' ON THE FUCACEAE STANDING CROP, (IN SPANISH),
Instituto de Investigaciones Pesqueras Vigo (Spain). Laboratorio de Investigaciones Pesqueras
F. X. Niell, and Y. J. Buela.
Investigacion Pesquera. Vol 40, No 1, p 137-149, 1976. 5 fig, 2 tab, 6 ref.

Descriptors: Aquatic plants, *Benthic flora, *Kraft mill, *Lignins, *Mussels, Industrial wastes, *Water pollution effects, Pulp and paper industry, Kelps, Biomass, *Pulp wastes, Standing crops, Bays, Plant populations, Mollusks
Identifiers: *Spain(Pontevedra Bay), Intertidal zonation, Mytilus, Fucus, Lignosulphonic residues.

Populations of intertidal fucaceae in the vicinity of a Kraft pulping waste discharge in Pontevedra Bay, Spain, show the effects of pollution. There is a total abiotic zone in the immediate vicinity of the discharge; farther on, a semi-biotic zone is found, and farther distant a zone with some eutrophic population characterized by an abundance of Mytilus and Ulvales. The biomass is lower near the discharge. There is a high negative correlation between lignosulphonic residues and biomass. (Katz)

A BIOENERGETICS-BASED MODEL FOR POLLUTANT ACCUMULATION BY FISH. SIMULATION OF PCB AND METHYL-MERCURY RESIDUE LEVELS IN OTTAWA RIVER YELLOW PERCH (PERCA FLAVESCENS),
National Research Council of Canada, Ottawa (Ontario). Div. of Biological Sciences.
R. J. Nortstrom, A. E. McKinnon, and A. S. W. deFreitas.
Journal of the Fisheries Research Board of Canada, Vol 33, p 248-267, 1976. 7 tab, 8 fig, 5 ref.

Descriptors: *Yellow perch, *Path of pollutants, *Growth rates, *Absorption, *Mathematical models, *Polychlorinated biphenyls, *Mercury, *Pesticide residues, *Pesticide kinetics, Metabolism, Fish physiology, Pesticides, Kinetics, Respiration, Seasonal, Temperature.
Identifiers: Perca flavescens, Bioenergetics, Bioaccumulation.

A pollutant accumulation model is developed which successfully predicts concentrations of PCB's and methylmercury in tissue of yellow perch (Perca flavescens). The model is based on pollutant biokinetics coupled to fish energetics. The expression for metabolic rate includes a growth dependent term for estimating the contribution to metabolism of seasonal and annual growth in each age-class. Pollutant clearance is related to body weight raised to the power of -.58 but is independent of metabolic rate. Under steady state conditions of chronic exposure, the predicted ratio of uptake to clearance is roughly constant at all weights, and the slope of a curve of log pollutant concentration in tissues vs. log body weight can be used to establish the exponent of body weight for clearance. riptors: *Bioassay, *Cadmium, *Absorption, physiology, Laboratory tests, *Catfishes, ls, Analytical techniques, Pollutant identifi- n, Water pollution effects.
ifiers: Bioaccumulation, Magnification, ue analysis, *Hematology.

uptake and tissue distribution of cadmium in h (Ictalurus punctatus) was studied following sure of catfish to varying concentrations of ium and alterations in hematological con- nts resulting from this exposure were ex- ed. The cadmium concentrations found in the were in trace amounts and appeared to be in- dent of cadmium exposure. Liver and kid- accumulated cadmium with the amount of ium accumulated in the kidney increasing increased cadmium exposure. The greatest gical magnification of cadmium in the liver idney occurred at the lowest cadmium expo- level (12 x and 41 x, respectively). Con- ntly, tissue levels of cadmium cannot be cor- d with ambient cadmium levels. Exposure of h to cadmium did not produce signficiant dif- ces in hematological constituents between ol and test fish. EFFECTS OF COPPER ON SURVIVAL AND OSMOREGULATION IN MARINE AND BRACKISH WATER ISOPODS (CRUSTACEA),
Liverpool Univ., Port Erin (England) Dept. of Marine Biology.
M. B. Jones.
In: Proceedings 9th European Marine Biology Symposium, H. Barnes, ed., Aberdeen University Press, p. 419-432, 1975. 6 fig., 55 ref.

Descriptors: *Copper, *Salinity, Stress, *Mortality, Environmental effects, *Lethal limit, Brackish water, *Crustaceans, *Isopods, Sea water, *Toxicity, *Bioassay, Osmosis, Invertebrates, Metals, Water pollution effects, Laboratory tests, Animal physiology.
Identifiers: Sublethal effects, Synergistic effects, *Osmoregulation.

A concentration of 10 mg/l copper was highly toxic to marine and brackish water isopods at salinities ranging from 100-1 parts per hundred sea water; each species had over 50 parts per hundred mortality even at optimum conditions of salinity at the LT50 values decreased with decreased salinity. Mortality did not reach 50 parts per hundred in full sea water with 1 mg/l copper, but a decrease in salinity caused an increase in the toxicity of the metal and shortened the LT50 times. In the absence of copper, the marine species were able to survive in salinities from 100 parts per hundred to 40 parts per hundred sea water, and the brackish water forms from 100 parts per hundred to 1 parts per hundred sea water, by maintaining their haemolymph osmotic concentration above that of the outside sea water. 1 mg/l copper caused a significant lowering of this osmotic pressure, particularly in dilute salt solutions. This suggests that copper acts synergistically with salinity, and concentrations of copper that are sub-lethal at optimum conditions become increasingly toxic as environmental stress is increased. (Katz)
W76-12333

ACUTE TOXICITY OF PHOS-CHECK (TRADE NAME) 202 AND DIAMMONIUM PHOSPHATE TO FATHEAD MINNOWS,
Environmental Health Lab., Kelley AFB, Tex.
R. C. Inman.
Available from the National Technical Information Service, Springfield, Va 22161, as AD-A006 122, $4.00 in paper copy, $3.00 in microfiche. Report EHL(K)74-31, December, 1974. 3 tab., 1 fig., 13 ref.

Descriptors: *Toxicity, *Bioassay, Freshwater fish, *Ammonium compounds, Analytical technique, *Minnows, *Phosphates, Laboratory animals, Water analysis, Hydrogen ion concentration, Water pollution effects, *Pollutant identification.
Identifiers: *Fathead minnows, Static bioassay, Phos-Check 202, Di-ammonium phosphate, *Fire-retardants, Dynamic bioassay, 96 hr LC50.

Fathead minnows were exposed to diammonium phosphate (DAP) and PHOS-CHECK (Trade Name) 202 (PC202) during static and dynamic bioassays. In static bioassays the 96 hour LC50 of DAP was 155 mg/l. The 96 hour LC50 of PC202 was 1320 microliters of the fire-retardant slurry per liter. The DAP concentration in the PC202 slurry would have been 150 mg/l at the 96 hour LC50 concentration. The incipient LC50 based on dynamic bioassays was 1022 microliters slurry per liter. Based on EPA recommendations of unionized ammonia not exceeding 0.02 mg/l, the recommended limit for PC202 was 66 microliters slurry or 3 mg DAP per liter at pH 7.8. At higher pH values the DAP or PC202 recommended concentrations would be even lower. (Katz)

A REVIEW OF LITERATURE ON THE USE OF POTASSIUM PERMANGANATE (KMN04) IN FISHERIES,
Bureau of Sport Fisheries and Wildlife, Fayetteville, Ark. South Central Reservoir Investigations.
T. O. Duncan.
Report FWS-LR-74-14, March, 1974. 61 p., 4 tab., 154 ref.

Descriptors: *Toxicity, Freshwater fish, *Bioassay, *Fish diseases, Fish establishment, Fish farming, Fish handling facilities, *Fish hatcheries, *Fish parasites, *Aquaculture, *Reviews, *Bibliographies, Potassium compounds, Aquaria, Fish eggs, Fish sterilants, Parasitism, Algicide, Fungicide, Fisheries.
Identifiers: *Potassium permanganate, Literature reviews.

Potassium permanganate is one of the most widely used inorganic chemicals in the world. Since its first use in fish culture in 1893, potassium permanganate has been used: primarily as a disinfectant in fish hatcheries, aquaria, raceways, ponds, and water supplies; for removal of fish parasites; to reduce disease, or as a disease preventative, especially on wounds of fish; for detoxification of fish toxicants such as rotenone and antimycin; for fungus and algae control; and temporary oxygen depletion problems in ponds. In foreign countries, potassium permanganate is used for removal of parasites before the live fish is sent to market, as well as a disinfectant. Complete review of literature concerning potassium permanganate's use in fisheries is presented. (Katz)

QUALITY OF POTATOES GROWN ON FIELDS IRRIGATED WITH WASTEWATERS OF COAL-TAR CHEMICAL AND METALLURGICAL PLANTS, (IN RUSSIAN),
Kiev Inst. of Nutritional Hygiene (USSR).
L. A. Stempkovskaya, L. R. Polishchuk, and N. M. Barabanova.
Gig Sanit. 11, p 97-98, 1974.

Descriptors: *Potatoes, *Soil disposal fields, Irrigation practices, Chemical wastes, *Industrial wastes, Organic wastes, Nitrites, Ammonia, Chlorides, Microbial degradation, Sulfides, Water reuse.
Identifiers: Cyanides, Cyanates, Thiocyanates.

Potatoes grown on experimental plots irrigated with wastewaters from coal-tar chemical and metallurgical plants which contained large amounts of organic and inorganic chemicals were studied. Nitrites, thiocyanates, ammonia and chlorides accumulated in the potatoes during growth on the plots. All organic ingredients, cyanides and sulfides of the wastewaters were absent in the potatoes. The absence of these substances can be explained by their breakdown in the soil and in the plant itself under the effect of various factors (microbiological, physicochemical, etc.)--Copyright 1975, Biological Abstracts, Inc.

WATER QUALITY AND WASTE DISPOSAL IN MONTANA,
Montana State Univ., Bozeman. Dept. of Botany and Microbiology.
J. W. Jutila.
Montana Agriculture - Focus on Improving the Environment, December 3-4, 1970, p. 61-68. 1 fig, 2 tab.

Descriptors: *Water quality, *Waste disposal, *Montana, *Water pollution sources, *Eutrophication, *Nitrates, *Phosphates, *Water pollution effects, Detergents, *Farm wastes.

Many Montana rivers and streams are being polluted with human and agricultural wastes, even at their headwaters, to the extent that the quality of

water of the Missouri River along its entire length may be seriously compromised. Surface waters are becoming so fertilized by man's activities that objectionable growths of water flora appear in abundance. In 1957, several teams of investigators from the Montana State University investigated the nature of the pollution problem in the East Gallatin River and its tributaries. Phosphates and nitrates, coming from sanitary sewer systems, synthetic detergents, burial of solid wastes, and excreta of farm animals were the primary factors causing undesirable water changes. Federal and state agencies have sponsored studies on the problem and solution of agricultural and human waste disposal pollution, emphasizing water quality studies. But far more research is required on the identity, fate, and biological and non-biological transformation of these pollutants. (Hisle-East Central)
W76-12359

HYGIENIC EVALUATION OF POTATOES GROWN IN SOIL IRRIGATED WITH EFFLUENTS FROM COKING AND CHEMICAL PLANTS OF THE DONETS COAL BASIN, (IN RUSSIAN),
Kiev Inst. of Nutritional Hygiene (USSR).
N. M. Vorob'eva, S. G. Vasiliu, and L. T. Lukashevich.
Vopr Pitan. 4, p 49-53, 1974.

Descriptors: *Potatoes, Effluents, *Industrial wastes, Rodents, *Soil disposal fields, Soil disposal fields, Irrigation practices, *Chemical wastes, Public health, Water pollution effects, *Water reuse.
Identifiers: *Donets Coal basin(USSR), *Coal processing wastes.

Experiments with albino rats on the influence of protracted feeding (8 mo.) of potatoes from plots irrigated with effluents from coking and chemical plants of the Donets coal basin (Voroshilovograd region) (USSR) revealed some functional disorders in the liver and reduced weight gain. The chemical composition of potatoes grown on plots irrigated with undiluted effluents differed somewhat from control samples.--Copyright 1975, Biological Abstracts, Inc.

COMPARISON OF ECOLOGICAL IMPACTS OF POSTULATED OIL SPILLS AT SELECTED ALASKAN LOCATIONS. VOLUME I. INTRODUCTION, SUMMARY, METHODOLOGY, EVALUATION AND APPENDICES,
Mathematical Sciences Northwest, Inc., Bellevue, Wash.
J. S. Isakson, J. M. Storie, J. Vagners, G. A. Erickson, and J. F. Kruger.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A017 600, $16.25 in paper copy, $3.00 in microfiche. U.S. Coast Guard Final Report No. USCG-D-155-75, June 1975. 614 p, 5 append. DOT-CG-42913-A.

Descriptors: *Continental Shelf, *Alaska, *Environmental effects, *Water pollution effects, *Oil spills, *Oil pollution, Resources development, *Weathering, Treatment, Water resources, Marine animals, Marine plants, Invertebrates, Fish, Vegetation, Dispersion, Marine fish.
Identifiers: *Outer Continental Shelf, *Ecological impact, *Environmental impact, Containment.

A ranking of potential environmental impact for spills of crude oil, diesel-2, bunker C, and gasoline in amounts ranging from 100 to 50,000 barrels was made for specific sites at Yakutat Bay, Valdez Harbor, Valdez Narrows, Drift River Channel, Port Graham, Kamishak Bay, Unimak Pass, Port Noller, Kvichak Bay, St. Matthew Island, Offshore Prudhoe, Onshore Prudhoe, Nome, Cape Blossom Channel, Colville River, Yukon River, and Denali Fault. Spills were assumed to disperse from inertial, viscous, surface tension, wind and current forces. Most probable wind and current conditions were utilized. Sites were characterized in terms of eight species habitats. Most probable cases were evaluated. A rating system was devised to characterize the impact based upon estimated species abundance, importance of species, and the impact of oil on such species over the short and long term. Impacts were estimated with the use of three-dimensional matrices. The highest impact ratings were obtained for spills at Port Graham, Valdez Narrows, Unimak Pass, and the Yukon River Crossing, assuming no spill cleanup. The same five locations dominated the impact rating where containment/cleanup were assumed to take place. Data gaps were noted and future studies are recommended. (Sinha-OEIS)

TOXIC EFFECTS OF OIL DISCHARGED FROM SHIPS,
Exxon Research and Engineering Co., Linden, N.J. Government Research Labs.
J. W. Frankenfeld, J. J. Elliott, R. E. Bentley, and B. H. Sleight, III.
Available from the National Technical Information Service, Springfield, VA 22161 as AD/A-022 902, $6.00 in paper copy, $3.00 in microfiche. U.S. Coast Guard Final Report No. USCG-D-16-75, December 1975. 138 p, 22 fig, 48 tab, 55 ref, 2 append. DOT-CG-51073-A.

Descriptors: *Water pollution effects, *Environmental effects, *Oil spills, *Oil pollution, *Toxicity, Fish, Shellfish, *Water pollution effects, Freshwater fish, Sea water, Shrimp, Minnows, Continental Shelf.
Identifiers: *Outer Continental Shelf, Biological effects, Fathead minnows, Mimmichog.

A study was conducted to determine the portions of six petroleum products which are dispersed and dissolved in water under specified conditions and the toxic effects of both the dissolved and the dispersed-plus-dissolved fractions on selected test organisms. The oils employed included: a Kuwait and a West Texas Crude, a marine diesel fuel, Navy Distillate and Navy Special fuel oils and a 9250 lubricating oil. The test organisms employed were the fathead minnow (Pimephales promelas), mimmichog (Fundulus heteroclitus) and the brine shrimp (Artemia salina). The effects of time, temperature and salinity were investigated. In addition, the maximum solubility of each test oil in fresh water was determined by means of partitioning conditions. Two types of analytical methods, total organic carbon determinations (TOC) and an extraction-infrared procedure were employed. Maximum observed solubilities in fresh water ranged from 3.1 ppm for the 9250 lube oil to 35 ppm for the light Kuwait crude. Solubilities in salt water were lower than fresh water by a factor of 2-4 while reducing the temperature from 77F to 57F had a lesser effect. Most fresh water dispersions settled rapidly for 48 hours and then reach near equilibrium; salt water and cold temperature dispersions settled faster. (Sinha-OEIS)
W76-12380

FIRST STUDIES ON THE ZOOPLANKTON OF THE LOTIC WATERS OF THE MIDDLE PARANA RIVER BASIN, (IN SPANISH),
J. C. Paggi, and S. J. Depaggi.
Physis Secc B Aguas Cont Org. 33(86), p 91-114, 1974.

Descriptors: *Zooplankton, *Lotic environment, *South America, River basins, Ecology, Salinity, Water temperature, Hydrogen ion concentration, Copepods, Turbidity, Crusteoceans.
Identifiers: *Parana River basin(Argentina).

The information obtained in an early stage of a series of investigations about the ecology of zooplankton in the Middle Parana River (Argentina) is analyzed. The objective was to study the community structure and evolution of zooplankton for 17 mo. and to estimate the relative importance of some environmental parameters in this process. Three places were sampled monthly between the cities of Parana and Santa Fe. Total salinity, pH, temperature, turbidity and hydrological regime were studied. The community contains 90 spp. made up of Rotatoria, Copepoda and Cladocera, being almost all true planktonic species while littoral and benthic ones are scarce. The communitary structure is very similar to that of regional lenitic bodies of water, although the diversity of Copepoda is somewhat less. Some species not recorded in regional lenitic waters are found in these rivers. The environmental parameters showing the highest correlation to the quantitative fluctuations of zooplankton are turbidity and hydrological regime, principally the former.--Copyright 1975, Biological Abstracts, Inc.

THE PASSAGE OF TRITIUM WITH DRINKING WATER INTO THE BODY OF RATS AND THEIR PROGENY IN A CHRONIC EXPERIMENT, (IN RUSSIAN),
Y. I. Moskalev, A. M. Lyaginskaya, and A. G. Istomina.
Gig Sanit. 11, p 35-37, 1974.

Descriptors: *Tritium, *Potable water, Rodents, *Digestion, Absorption, Toxicity, Water pollution effects.
Identifiers: Tritium oxide.

The kinetics of 3H accumulation in the body of rats (male and female), pregnant rats and rattlings during the chronic entry of tritium oxide with the drinking water was studied. When mixed feedstuffs were given, the 3H contents in the water phase of the body of adult rats amounted to 42-44% of its concentration in the drinking water, in the water phase of rattlings on the 3rd-15th day, it equaled 28%. No placental barrier existed for tritium oxide in the body of pregnant rats.--Copyright 1975, Biological Abstracts, Inc.

s: *Endemic fluorosis, *Punjab(India).

ive surveys of 10 villages from a known emic fluorosis area of Punjab (India), ne Bhatinda and Sangrur Districts, an ef- made to examine each individual and to ys on as many as possible. A very high in- f dental (44-81%) and skeletal (2.8-81%) was observed but no strict correlation he 2 manifestations could be established. and neurological fluorosis occurred re frequently in men than in women. The tors determining fluoride toxicity were de concentration in drinking water and ion of exposure to this hazard. Yet in identical concentrations of fluoride in water, variations in the incidence of the disease occurred. They were related to other chemical constituents of drinking water which are protective against the development of fluorosis such as Mg, Ca and total hardness. Physical stress which was chiefly responsible for the severity of disease in men was also responsible for the neurological complication. Mal-nutrition played no etiological role in this disease. Food grown in the fluorotic soil did not provide a significant quantity of fluoride.--Copyright 1973, Biological Abstracts, Inc.

PHOSPHATE RELEASE AND SORPTION BY LAKE MOHEGAN SEDIMENTS,
City Coll., New York. Dept. of Civil Engineering.
J. Fillos, and H. Biswas.
Journal of the Environmental Engineering Division, Proceedings of the Society of Civil Engineers, Vol. 102, No. EE2, p 239-249, April 1976.

Descriptors: *Environmental engineering, *Eutrophication, *Lakes, *Phosphorus, *Sediments, Lake basins, Water management(Applied), Water quality, Sorption, Aerobic conditions, Anaerobic conditions, Water pollution effects.

The release rate of phosphorus from lake sediments to the overlying water was measured in a laboratory experiment. The sediments were from Lake Mohegan, a eutrophic lake in northern Westchester County, New York. The sorption capacity for phosphorus of Lake Mohegan sediments depends on the oxygen concentration in the overlying water. When the phosphate concentration in the overlying water is high, above 1-2 mg/1, the sediments will sorb phosphorus from the overlying water under both aerobic and anaerobic conditions. Below this phosphate value, the sediments will release phosphorus under anaerobic conditions while they will sorb phosphorus under aerobic conditions. (Bell-Cornell)

A EUTROPHICATION MODEL FOR A LAKE,
Royal Danish School of Pharmacy, Copenhagen.
S. E. Jorgensen.
Ecological Modelling (International Journal on Ecological Modelling and Engineering and Systems Ecology) Vol. 2, No. 2, p 147-165, June 1976. 9 fig, 11 tab, 22 ref.

Descriptors: *Ecosystems, *Lakes, *Mathematical models, *Eutrophication, *Waer quality, Phytoplankton, Kinetics, Biomass, Waste water treatment, Equations, Systems analysis, Simulation analysis, Forecasting, *Model studies, Path of pollutants.

Different lake models were tested against measured values. It was found that a model based upon phytoplankton population dynamics gave a better description than a model based upon Monod's kinetics. The calibration of the model showed that it was necessary to use a recently developed submodel for sediment-water nutrient exchange. Furthermore, the work showed that it was essential to include in the model three trophic levels, denitrification, a time dependent nitrogen input and Steele's expression for the grazing rate. A prediction for different waste water treatment alternatives was worked out. (Bell-Cornell)

DOCUMENTATION OF SELECTED CONSTRUCTS AND PARAMETER VALUES IN THE AQUATIC MODEL CLEANER,
National Oceanic and Atmospheric Administration, Ann Arbor, Mich. Great Lakes Environmental Research Lab.
D. Scavia, and R. A. Park.
Ecological Modelling, (International Journal on Ecological Modelling and Engineering and Systems Ecology), Vol. 2, No. 1, p 33-58, March 1976. 10 fig, 6 tab, 58 ref.

Descriptors: *Aquatic environment, *Model studies, *Simulation analysis, *Zooplankton, *Phytoplankton, Phosphorus, Nitrogen, Behavior, Temperature, Biomass, Nutrients, *Lakes, Systems analysis, *New York.
Identifiers: Consumption, Food, Process rates, Population-age structure, *Lake George(NY).

Process representations critical to the phytoplankton and zooplankton submodels are described. These include constructs for: light- and nutrient-limitations and their interaction, temperature, consumption, and population-age structure. Values for key parameters are documented with reference to the literature on aquatic ecology and ecological modelling. Time-course relationships of the processes affecting the phytoplankton, zooplankton, phosphorus and nitrogen compartments are presented and discussed. These serve as additional documentation and are an important result of modelling synthesis. (Bell-Cornell)

GROWTH AND DISSIPATION OF PHYTOPLANKTON IN CHESAPEAKE BAY: I. RESPONSE TO A LARGE PULSE OF RAINFALL,
Johns Hopkins Univ., Baltimore, ,Md. McCollum-Pratt Inst.
M. E. Loftus, D. V. Subba Rao, and H. H. Seliger.
Chesapeake Sci. 13(4), p 282-299, 1972.

Descriptors: *Phytoplankton, *Chesapeake Bay, *Rainfall, Sampling, *Fluorescence, *Eutrophication, Nutrients, Bays, Dinoflagellates, Methodology, *Plant growth, Dissipation, Pollutant identification.

Approximately 90 km2 of Chesapeake Bay contiguous with the Severn, South, Rhode and West Rivers were surveyed by in vivo chlorophyll fluorescence and captured samples following a large pulse of rainfall in summer, 1971. The growth and subsequent dissipation of blooms containing chlorophyll a concentrations up to 40 X pre-bloom values were completed within 21 days. A distinction is made between the blooms produced by nutrient pulses and dinoflagellate blooms normally observed in the fall. In the former, these is a complete change of phytoplankton relative species composition. The latter is a phototactic segregation of species already existing within the water column. The methodology is presented and a mathematical description is attempted.--Copyright 1973, Biological Abstracts, Inc.

SCHISTOSOMIASIS AND OTHER HUMAN PARASITOSES OF LAKE LINDU IN CENTRAL SULAWESI (CELEBES), INDONESIA,
M. D. Clarke, W. P. Carney, J. H. Cross, P. Hadidjaja, and S. Oemijati.
Am J Trop Med Hyg. 23(3), p 385-392, 1974.

Descriptors: *Animal parasites, *Human diseases, Asia, *Parasitism, Lake basins, Water pollution effects.
Identifiers: Ascaris-Lumbricoides, Brugia-Malayi, Celebes, Chilomastix-Mesnili, Echinostoma-Lindoense, Endolimax-Nana, Entamoeba-Coli, Entamoeba-Hartmanni, Entamoeba-Histolytica, Enterobius-Vermicularis, Giardia-Lamblia, Hymenolepis-Diminuta, Iodamoeba-Butschlii, Necator-Americanus, Plasmodium-Falciparum, Plasmodium-Vivax, Schistosoma-Japonicum, *Schistosomiasis, Strongyloides-Sterscoralis, Sulawesi, Trichuris-Trichiura, *Lake Lindu(Indonesia).

The isolated Lake Lindu Valley of Central Sulawesi is the only reported Indonesian focus of oriental schistosomiasis. In April 1972, a parasitological survey involving over 1400 people was conducted in the valley's 4 villages. Schistosoma japonicum infections were detected in 37.9% of all Lindu people by direct and formalin-ether concentration examinations of stools: 57.1% in Anca, 42.4% in Tomado, 30.0% in Langko, and 11.7% in Puroo. Peak prevalences of schistosomiasis were reached in the 2nd decade of life and remained high thereafter among both male and female populations. Prevalence of other helminthic parasites are reported as follows: Hymenolepsis diminuta, <0.1%; Strongyloides stercoralis, 0.2%; Enterobius vermicularis, 0.8%; Trichuris trichiura, 8.8%; Ascaris lumbricoides, 15.2%; and hookworm (Necator americanus), 69.6%. No Echinostoma lindoense infection was detected. Intestinal protozoa including Entamoeba coli, Giardia lamblia, Endolimax nana, Entamoeba histolytica, Iodamoeba butschlii, Entamoeba hartmanni and Chilomastix mesnili were also encountered. In blood smears collected from 1348 people, Brugia malayi microfilariae were detected in 5.4% of the population, and Plasmodium vivax and Plasmodium falciparum in 2.5%. Filariasis was more frequent in older age groups, while most malaria infections were found in Lindu residents 10 yr old or younger.--Copyright 1974, Biological Abstracts, Inc.

HYDROCARBON RESIDUES IN IVORY COAST WATERS,
D. Binet, and E. Marchal.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-237 797-T, $3.50 in paper copy, $3.00 in microfiche. Report EPA-TR 69-75, August 1974, 9 p. 4 tab. (Transltion).

Descriptors: *Coastal areas, *Benthos, *Atlantic oil, *Oil pollution, *Oily wastes, *Waste water disposal, International waters, *Marine fish, Commercial fish, *Fish eggs, *Fish reproduction, *Fish harvest, Fisheries, *Organic compounds.
Identifiers: *Pelagic fish, *Tar globs, *Sardinella, Sardines, *Ivory coast waters, Stomach analysis, Fishery decline.

For some years, the beaches of Ivory Coast have become more and more polluted by hydrocarbon residues. In addition, plankton net hauls have shown that the quantities of hydrocarbons in suspension in sea water are far from being negligible and generally more important in shallow water near the coast. The presence of oil in the stomachs of pelagic fish and the scarcity of eggs and larvae of these fish suggest the hypothesis that the decrease in the yield of these fish in Ivory Coast waters may at least partially be due to this oil. The authors suggest that strong action should be taken in order to force oil tankers to respect international rules concerning tank cleaning (at a minimum distance of 100 miles offshore) until better cleaning methods are employed. THE EUTROPHICATION OF TITI LAKE AND ITS CONSEQUENCES FOR THE POPULATION OF DYNAMICS OF ZOOPLANKTON: 2, (IN GERMAN),
Universidad Austral de Chile, Valdivia. Instituto Zoologio.
E. Szymanski-Bucarey.
Arch Hydrobiol Suppl. 47(2), p 167-238, 1974.

Descriptors: *Eutrophication, Europe, Lakes, *Zooplankton, *Sewage, *Nitrates, *Phosphorus, Nutrients, Silica, Diatoms, Anabaena, Phytoplankton, Rotifers.
Identifiers: Asterionella-Formosa, Cyclops-Abyssorum, Diaphanosoma, Fragilaria-Cortonensis, Leptodora-Kindtii, Mixodiaptomus-Laciniatus, *Titi Lake(West Germany).

Lake Titi, a moraine-dammed lake in the upper Black Forest of (West) Germany, is naturally oligo-dystrophic but is now eutrophic, owing to sewage input. Observations were made between May, 1968-Nov., 1970, during a critical transition in the eutrophication of the lake. The inflow from the brook stratifies in the lakes from June until Nov. In late autumn it provides O2 to the deep hypolimnion before the full circulation sets in. The annual cycle of concentrations of various chemical components in the brook is due to variations of the water supply and in the amount of sewage. Alkalinity, pH, Ca, Mn and silicate concentrations were all approximately the same as reported in earlier works. Nitrate concentration, however, had doubled, and phosphate levels were 10 times greater than before. The elevated nutrient levels were due to the sewage. Silicate uptake by diatoms has practically doubled in comparison to earlier readings. In 1969, Asterionella formosa was the dominant form of phytoplankton. In 1964 Asterionella was evident in quantity only during spring and fall. In 1970 an extreme growth of Fragilaria cortonensis (July-Aug.) was followed by a bloom of Anabaena (Sept.-Oct.). The population curves of the most important species of planktonic rotifers, Cladocera and Copepoda were followed for 3 yr (1968-70). Leptodora kindtii appeared in the Titisee in 1969. The Diaphanasoma population had strongly decreased since eutrophication set in. The population dynamics of Mixodiaptomus laciniatus and Cyclops abyssorum were analysed. METABOLIC RATES OF ARCTIC LAKES,
Atlantic Biological Station, St. Andrews (New Brunswick).
H. E. Welch.
Limnol Oceanogr. 19(1), p 65-73, 1974.

Descriptors: *Arctic, *Canada, Lakes, *Respiration, Winter, Turbidity, Drainage basins, *Productivity, Analytical techniques, *Metabolism, Fjord.
Identifiers: Cornwallis Island(Canada), Plant cover, *Arctic lakes, Disko Fjord(Greenland).

A technique for calculating the respiration rates of arctic lakes during winter is presented. Respiration rates range from a low of 30 g O2 m-2 yr-1 at Resolute, Cornwallis Island (Canada), to over 200 at Disko Fjord, Greenland, but a general range of 40-70 can be expected at 75 N latitude. Differences in lake productivity are tentatively ascribed to variations in turbidity and plant cover in the drainage basin.--Copyright 1974, Biological Abstracts, Inc.

TIME PARAMETER EVALUATION IN F FLOCCULANT DESTABILIZATION,
New Mexico State Univ., University Park. of Civil Engineering.
B. F. Duff, and W. A. Barkley.
Available from the National Technical Inf tion Service, Springfield, Va 22161, as PB-25 $5.50 in paper copy, $3.00 in microfiche. Mexico Water Resources Research Institute Cruces, WRRI Report No. 062, March 1976, 34 fig., 9 tab., 34 ref. append. OWRT A NMEX (2).

Descriptors: *Flocculation, *Waste Water ment, *Chemical precipitation, Colloids, wastes, Zeta potential, Turbidity, Pol trolytes.
Identifiers: Latex, Aluminum sulfate, Dual f lants.

Research was conducted to obtain an op time differential between the addition of dua culants, aluminum sulfate and polyelectroly a colloidal suspension. A synthetic co suspension, latex, was used in order to achie best available reproducibility. Both cation anionic polyelectrolytes were examined in c tion with aluminum sulfate (alum). To si tests, pH, ionic strength, and temperatur held constant. The dependent paramete destabilization measurement were turbidity solids, zeta potential, and A13+ concent Various alum concentrations, polyelectroly centrations, and time intervals were exa For the cationic polyelectrolyte, the optimu for addition was dependent upon amount o used, but the cationic polyelectrolyte sho ways be added after the alum. The optimu for the anionic polyelectrolyte was 5 minute alum had been added to the system. Th suspension gave reproducible results dur testing period. The use of zeta potential m ments along with the turbidity and total proved useful in evaluating what happened suspension. Turbidity by itself could be n

g. The time difference between the addition of imary and secondary flocculants affects the effi-ncy of coagulation in a synthetic colloidal stem, this conclusion is probably at least qualita-ely valid for real colloidal systems. Water treat-nt plants should attempt to evaluate this time ctor to improve water treatment without addi-nal chemical cost. (See also W76-12212) (Hain-w Mexico State)

OSAL ALTERNATIVES FOR INTERMIT-T SAND FILTER SCRAPINGS UTILIZA-AND SAND RECOVERY,
Center for Water Resources Research, n.
Elliott, D. S. Filip, and J. H. Reynolds.

Available from the National Technical Information Service, Springfield, VA 22161 as PB-257 492, $4.50 in paper copy, $3.00 in microfiche. Utah Water Research Laboratory Publication, PRJER033-1, June 1976. 54 p, 40 fig, 42 tab, 41 ref, 3 append. OWRT A-033-UTAH(1). 14-34-0001-6046.

Descriptors: Filtration, Lagoons, Algae, Irrigation, Soils, *Oxidation lagoons, *Waste water disposal, *Cost analysis, *Filters, Sands, Bioassay, Lysimeters, Fertilizers, Alternative costs, *Utah, Water reuse.
Identifiers: Logan(Utah), *Sand filters, *Land application, Soil conditioners.

A three phase study is used to develop disposal alternatives and cost analysis for algae laden sand scrapings removed from intermittent sand filters used to polish wastewater lagoon effluent. Phase I, Irrigation Technique, explores the feasibility of supplying sufficient water to sand scrapings to leach out entrapped material. Details of removal with amount of water applied are presented. Phase II, Soil Application, tests with lysimeters soil response to application of the algae laden sand material. Physical and chemical parameters are not markedly altered where algae laden sand is applied to the soil surface. Phase III, Plant Bioassays, grew tall fescue on lysimeters which had algae laden sand scrapings applied and compared this growth response with lysimeters having no additives to a clay soil and lysimeters having ammonium nitrate added as fertilizer. Results indicate that all three disposal alternatives are viable recourses for sewage sand filter sand deposition and utilization. Cost analysis indicates that an irrigation technique may be less expensive.

SOME CAUSES OF ANOMALIES IN OXYGEN MASS TRANSFER IN POLLUTED WATER, (IN RUSSIAN),
Akademiya Nauk Latviiskoi SSR, Riga. Inst. of Wood Chemistry.
O. Y. Vitols, V. P. Paicha, and R. E. Reizin'sh.
Latv Psr Zinat Akad Vestis. 9, p 24-30, 1973.

Descriptors: *Oxygen, *Mass transfer, *Aeration, Oxygen demand, Bacteria, Model studies, Activated sludge, *Sludge treatment, *Waste water treatment.
Identifiers: *Aerators.

Coefficient alpha of polluted water (model) in 2 different aerated laboratory vessels was investigated. In the presence of SAS (surface active substances) it depended on the type of aerator. In the presence of biological systems, the O2 consumption depended on the physiological condition of the bacteria, which are very sensitive to changes in the O2 concentration. Large changes in the physiological condition occur even after short-term (10-20 min) subjection to the complete absence of O2. The efficiency of the aerator in the presence of bacterial sludge was detectable only under natural conditions and allowed only minor deviations from industrial ones.--Copyright 1975, Biological Abstracts, Inc.

WOOL PROCESS WATER PURIFICATION PLANT.
South African Patent ZA 7305-609. Issued June 11, 1974. Derwent French Patents Abstracts, Vol. V, No. 35, p F2-F3, July, 1974.

Descriptors: *Patents, Oil wastes, *Textiles, *Industrial wastes, *Waste water treatment, Water reuse, Separation techniques, Evaporation, Recycling.
Identifiers: *Wool process waste water.

The design for a wool process water purification plant has been patented. The oily or dirty water from baths for washing and rinsing wools is subjected to a first mechanical purification. During this purification, crude earth and mud are extracted and gathered together to form a throw-out and water is recovered to be reused. The throw-out then goes through a second mechanical purification during which heavy earth and oils are separated and recovered and light mud particles are separated and recycled with the throw-out. The effluent from the second purification is separated and recovered by evaporation. The condensation water is reused; the residual oils and earth are extracted and recovered from the residue of the evaporation stage by mechanical separation. The residual water is also extracted by mechanical separation and then recycled for evaporation with the effluent from the second purification. (Orr-FIRL)
W76-12338

SIEVE UNIT FOR AQUEOUS SLUDGE AND FIBROUS (SUSPENSIONS).
German Patent DS 2028-336. Issued May 16, 1974. Derwent German Patents Abstracts, Vol. V, No. 21, p F3, June, 1974.

Descriptors: *Sludge treatment, *Textiles, *Pulp wastes, *Pulp wastes, *Fibers(Plant), *Sieves, *Patents, Liquid wastes, Filtration, :Waste water treatment, Industrial wastes.

A sieve unit for treating aqueous sludge and fibrous suspensions has been patented. It consists of a cylindrical, horizontal, stationary drum, with a coaxial perforated cylinder that can rotate inside the drum. A material infeed and a diluent liquid infeed enter the chamber from the same side. An inlet chamber is located between the liquid-infeed and the cylinder and is rigidly connected to the cylinder. The cylinder has an opening on the opposite end face, toward the coarse discharge connection. Applications of this apparatus include the filtering of effluents from textile and fiber mills. (Orr-FIRL)
W76-12339

SEPARATION OF WATER-SOLUBLE HEAVY METAL IONS FROM ACID STREAMS.
Netherlands Patent NL 7400-526. Issued July 17, 1974. Derwent Netherlands Patents Report, Vol. V, No. 31, p D3, September, 1974.

Descriptors: *Patents, *Metals, *Separation techniques, Ion exchange, Resins, Chemical precipitation, Mines, Waste water treatment, Chelation, Acid mine wastes.
Identifiers: Electroplating wastes, Cation exchange resins.

A procedure for the separation of water soluble heavy metal ions from acid streams has been patented. Aqueous solutions containing water soluble metal ions are passed through a cation exchange resin containing alkali ions. The heavy metal ions are deposited on the resin, producing a neutral effluent. The cation exchange resin is regenerated with a solution of an alkali metal chelate such as sodium acetylacetonate in alcoholic solution. The metal is then precipitated from the solution with an alkali metal hydroxide; the alkali earth metal chelate is recovered and recycled. This method can be applied to waters used in draining mines and in electroplating metal cleaning. (Orr-FIRL)
W76-12340

DECONTAMINATION OF WATER CONTAINING LIPOPHILIC SUBSTANCES.
Belgian Patent BE 805-716. Issued April 5, 1974. Derwent Belgian Patents Report, Vol. V, No. 17, p D1, May 31, 1974.

Descriptors: *Waste water treatment, *Industrial wastes, *Chemical wastes, Water pollution control, Flocculation, Polymers, Surface waters, Groundwater, Rivers, Potable water, *Patents.
Identifiers: *Lipophilic substances.

A patent was granted for a process for decontamination of water containing lipophilic substances such as mineral oils and pesticides. This involves flocculation treatment with ethylene polymers or copolymers which have less than 50 weight percent of other ethylenic monomers. The polymer used must also contain less than 2 mole percent, based on the monomers used, of a monomer having a carboxyl function, particularly carboxyl acids, esters or amides. The process is followed by a separation of polymer-containing contaminants. This process eliminates pollutants from surface water, groundwater, and river water, and results in water of potable quality. (Murphy-FIRL)
W76-12341

WOOL PROCESS WATER PURIFICATION PLANT.
French Patent FR 2196-971. Issued April 26, 1974. French Patents Abstracts, Vol. 5, No. 21, p D3-D4, June 28, 1974.

Descriptors: *Waste water treatment, *Industrial wastes, *Textiles, *Patents, Water reuse.
Identifiers: *Wool scouring liquor, Fuller's earth, Grease.

A patent was issued for a wool process water purification plant. Separation of fullers' earth sludge and fatty substances on a continuous recycling basis is achieved. Greasy wool passes through a series of washing tanks followed by rinsing baths. The washing water from the tanks is sent through a first mechanical purification phase in which raw earths, slurries, grease and water are separated. The water is fed back to the wash tanks, and the solids, without the grease, are remixed and fed to a second mechanical purification stage. Heavy earths and lighter sludge are extracted, followed by grease extraction and then by evaporation of the water condensate which was used in the rinsing baths. The remaining residue is further segregated and the water recycled. (Kramer-FIRL)

THE RENOVATION AND REUSE OF WATER FOR DILUTION AND HYDRAULIC TRANSPORT OF DAIRY CATTLE MANURE,
Massachusetts Univ., Amherst. Dept. of Agricultural Engineering.
R. E. Graves.
Available from University Microfilms, Ann Arbur, Michigan 48106. PhD Thesis, June, 1971, 120 p. 31 fig, 18 tab, 61 ref.

Descriptors: *Water reuse, *Waste dilution, Recycling, *Farm wastes, *Cattle, *Dairy industry, *Hydraulic transportation, Water pollution, Chemical oxygen demand, Biochemical oxygen demand, Ammonia, Nitrates, Waste treatment, Liquid wastes, Phosphate, Chlorides, Slurries, Aerobic treatment.
Identifiers: *Screening.

An evaluation was made of the concept of pretreatment by screening combined with aerobic stabilization and reuse of water as they might apply to the hydraulic handling of dairy cattle manure. Performance of a stationary sloping screen for separating solid material from dairy manure slurries was evaluated using different bar spacings and different slurry mixtures. Two different systems were used to treat screen effluent. One system consisted of primary settling, aeration and final settling; the other of aeration and final settling. No adverse effects on the treatment systems were noted from the reuse of water. Screening of water-manure slurries removes a significant amount of material from the liquid and makes subsequent treatment and handling easier. Screen effluent may then be irrigated, stored aerobically, or treated to allow reuse for hydraulic cleaning. The addition of screening will improve the operation of many systems now used for treatment of animal manure slurries. (Russell-East Central)

ment, Waste treatment, Waste water treatm
Waste water disposal.
Identifiers: *Waste management.

Waste management is an issue that the poultr
dustry must be prepared to deal with. This Sec
National Symposium did a great deal to inform
poultry industry of current waste managemen
ternatives. As expected, lagoons were discu
extensively throughout the symposium. M
problems such as poultry waste disposal on
farm, in the hatchery, and in the processing pl
were discussed. Hydraulic manipulation of wa
was described along with considerations of pr
odor control. Legal, social, and economic asp
of waste management were also dealt with. M
more study and research is needed so that
poultry industry can better deal with the prob
and changes of the future. (Russell-East Centr

HAVE TO 'THINK MAINTENANCE' IN AGING FEEDLOT RUNOFF SYSTEMS,
aska Farmer, 2 p., February 3, 1973. 3 fig.

riptors: *Feed lots, *Agricultural runoff, ration and maintenance, Costs, *Farm s, Management, Water pollution control, e treatment.
ifiers: *Debris basin, *Holding ponds, Waste gement.

Feedlots need proper maintenance. The best designed runoff control system can fail if it cannot be maintained properly. To keep cleaning chores easy one feedlot operator has installed gates at the end of debris basins and lot fences on top of debris dikes. These are used so that scraper equipment can remove manure solids which would have been left on the fence row and prevent the manure from being pushed under fence lines by livestock traffic. The final phase of the runoff system is a holding pond which holds storm runoff and pumps the wastes onto field crops. Problems of the system have been clogged riser slots caused by manure solids and hair and problems in pumping the wastes out of the holding pond onto field crops. (Marquard-East Central)

WLJ PREVIEWS FIRST COMMERCIAL MANURE SYSTEM,
G. Richardson.
Western Livestock Journal, Vol. 51, No. 1, p. 1, 7, November 6, 1972. 2 fig.

Descriptors: *Aerobic treatment, Dairy industry, Feed lots, Foam separation, Recycling, Lagoons, Degradation(Decomposition), Waste water treatment, Waste treatment, Odor, *Farm wastes.
Identifiers: Licom waste treatment system, *Odor control, Centrirator, Pasteurization.

DeLaval Separator Company has introduced the Licom Waste Treatment System, which can turn farm wastes into clear water and odor-free, pathogen-free mulch. Licom Systems I and II may be used for smaller operations while Licom III is used for those feedlots which must meet rigid ecological requirements. Licom I uses a liquid manure collecting pit which fills a reactor once weekly with wastes. In the reactor, aerobic bacterial action raises the temperature into the thermophilic range and in 5 to 7 days complete stabilization, decomposition, and pasteurization have occurred. Licom II uses the same procedure only with more reactors for more complete decomposition. Licom III is like Licom II with the addition of a flotation tank that separates fibrous matter from the liquid. For feedlots already using lagoons, a DeLaval Centrirator may be installed which will eliminate odors. (Marquard-East Central)

MANAGEMENT OF RUNOFF WATER IN RELATION TO FEEDLOT OPERATIONS,
Soil Conservation Service, Temple, Tex.
H. N. McGill.
In: Soil Conservation Service, Texas Tech University Workshop Committee on Feedlot Waste, Texas Tech University, Lubbock, July 28-29, 1971, 13 p. 6 fig, 2 tab.

Descriptors: *Feed lots, *Agricultural runoff, *Irrigation, *Storage capacity, *Farm wastes, Ponds, Management, Waste treatment, Texas, Waste disposal.
Identifiers: Holding ponds.

A system of runoff retention and irrigation is generally considered to be the most practical and economical form of runoff control in Texas. Because of this, information was gathered to determine necessary size ratios of irrigated areas to feedlot areas for adequate runoff control. The study revealed that the required storage capacity varies with the ratio of irrigated area to feedlot area and the location in the state. The eastern part of the state would need a large amount of storage capacity. Considerable flexibility of operation is permitted in the western part of the state by holding ponds with the capacity to impound 25-year, 24 hour runoff from feedlots. Although feedlot runoff is not a dependable irrigation water supply, it can be used to supplement other sources. (See also W76-12363) (Kehl-East Central)

DISSOLVED OXYGEN PROBE,
Fischer and Porter Co., Warminster, Pa. (Assignee).
R. L. Poole.
U.S. Patent No. 3,948,746, 4 p, 3 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 945, No 1, p 315, April 6, 1976.

Descriptors: *Patents, *Waste water treatment, Industrial wastes, *Water pollution treatment, *Aerobic conditions, Dissolved oxygen, *Monitoring, Instrumentation, Electrodes, Dissolved oxygen analyzers.
Identifiers: *Dissolved oxygen probes.

In aerobic treatment processes intended to purify sewage and industrial wastes, the dissolved oxygen is continuously measured in order to monitor and maintain the proper aerobic conditions. A

probe is described which incorporates a galvanic cell whose output current is proportional to dissolved oxygen. The highly sensitive probe also includes a temperature sensor to correct the readings for changes in the temperature of the liquid being tested. The probe has a hollow cylindrical casing of insulating material divided into a lower electrolyte chamber and an upper terminal chamber. Mounted on the stem coaxially within the electrolyte chamber is a tubular-shaped copper counter-electrode which is extended into the terminal chamber for electrical connection. The lower end of the electrolyte chamber is closed by a diffusion membrane which covers a measuring electrode and separates the cell from external liquid. The membrane is permeable to dissolved oxygen in the liquid in which the probe is immersed. Mounted on the end of the stem in the electrolyte chamber is a measuring electrode of gold or platinum, this electrode being connected to a terminal contact in the terminal chamber. The electrolyte chamber is filled with a solution of potassium hydroxide, so that when dissolved oxygen diffuses through the membrane, it is electrochemically reduced at the surface of the measuring electrode to generate a current proportional to the oxygen concentration. The copper counterelectrode is oxidized to complete the cell reaction. (Sinha-OEIS)

METHODS FOR REMOVING FLUOBORATES FROM AQUEOUS MEDIA,
Galson Technical Services, Inc., Syracuse, N.Y (Assignee).
J. Singh.
U.S. Patent No. 3,959,132, 5 p, 2 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 946, No 4, p 1739, May 25, 1976.

Descriptors: *Patents, *Waste water treatment, *Industrial wastes, *Water pollution treatment, Water pollution sources, Chemical reactions, Separation techniques, Hydrolysis, Aluminum, Lime.
Identifiers: *Fluoborates, Lead and tin plating industry.

Lead and tin fluoborates and fluoboric acid are widely used in lead and tin plating processes and appear as contaminants in the water used to rinse the plated parts. It has been discovered that fluoborates can be rapidly and efficiently removed from aqueous media by first hydrolyzing the fluoborates to fluorides with aluminum or an aluminum salt and then reacting the resulting fluorides with a calcium salt. This converts the fluorides to calcium fluoride, which is sparingly soluble and accordingly precipitates and can be readily separated from the aqueous liquid. The form in which the aluminum is added can be varied. Filings or other finely divided aluminum metal particles or a salt such as aluminum chloride or sulfate can be used. The conversion of the fluorides to calcium fluoride will typically be completed in a period of 5-30 minutes depending upon the form in which the lime is added. The reactions will proceed much more rapidly if a slurry is employed rather than a dry powder. Other compounds capable of contributing calcium ions to the precipitation reactions can be employed. However, lime is preferred because it also produces the desired elevation of pH. Furthermore, lime is an inexpensive source of calcium ion. The aluminum can be readily reclaimed and recycled. REVERSE OSMOSIS SYSTEM WITH AUTOMATIC FLUSHING,
Desalination Systems, Inc., Escondido, Calif. (Assignee).
D. T. Bray.
U. S. Patent No. 3,959,146, 4 p, 5 fig, 4 ref; Official Gazette of the United States Patent Office, Vol 946, No 4, p 1744, May 25, 1976.

Descriptors: *Patents, *Water purification, *Demineralization, Water quality control, *Reverse osmosis, Membranes, Membrane processes, Semipermeable membranes, Cleaning, Equipment, Waste water treatment.
Identifiers: *Flushing(Automatic).

A reverse osmosis system for purifying water comprises a module containing a semipermeable membrane. Feed water is introduced under elevated pressure, and a flow control device releases concentrate from the module while maintaining operating pressure. A storage tank is provided with a spigot for dispensing purified water. A by-pass pipe is arranged around the flow control device. A valve, normally closed, is placed in the by-pass pipe and means are provided to automatically open this valve concomitantly with delivery of purified water from the storage tank. The feed water introduced into the module is allowed to flow freely through the module and the by-pass pipe around the flow control device to flush and clean the membrane surface each time purified water is delivered from the tank dispensing means. The valve in the by-pass pipe is connected electrically or mechanically to the storage tank or spigot so that it opens and closes concomitantly. (Sinha - OEIS)

Identifiers: *Refinery wastes, Antwerp(Belgium).

The complex waste water treatment system at the Esso Petroleum Refinery at Antwerp, Belgium, is described. Waste water is generated at a rate of 8,500 tons/hour, and about 85% of the total waste water is cooling water. After preliminary oil separation, the waste water has an oil content of 30-50 g/cu m. After neutralization with sodium hydroxide, coagulation and flocculation with iron sulfate or aluminum sulfate and a polyelectrolyte, dissolved air flotation is performed to reduce the oil content to 10-15 g/cu m. Dissolved oil is finally removed by activated sludge treatment, which results in about 90% reduction of the BOD content. The residual oil content is below one g/cu m. (Takacs-FIRL)

THE CLOSED-CYCLE BLEACHED KRAFT PULP MILL,
Toronto Univ. (Ontario).
W. H. Rapson.
Chemical Engineering Progress, Vol 72, No 6, p 68-71, June, 1976. 2 fig, 22 ref.

Descriptors: Pulp and paper industry, *Pulp wastes, *Recycling, *Symbiosis, Industrial wastes, Costs, Water conservation, Effluents, Design criteria, *Treatment facilities, *Waste water treatment.

A closed-loop design for a bleached kraft pulp mill is described that provides for essentially effluent-free operation. The closed-cycle concept involves operating the wood room completely on recycled water. Accumulated suspended solids are settled, filtered or centrifuged out, and either burned or buried. A closed pressurized brown stock screening system uses only recycled filtrate. Screen rejects are filtered and recycled or burned. The amount of water used for washing the pulp in the bleach plant is sharply decreased by countercurrent washing and recycling chlorination filtrate to dilute unbleached pulp entering the first stage. Bleach plant effluent and evaporator condensates are used to wash the unbleached pulp and for other purposes in the chemical recovery system, eliminating the addition of fresh water in the pulping and chemical recovery systems. All chlorine in the bleaching chemicals ends up as sodium chloride which is recovered by a special process. Heat savings are also achieved as a result of decreasing the water requirements of the plant by using countercurrent washing. The capital cost of the closed-loop operation is expected to be only 5% more than conventional plants with no effluent treatment, and the operating cost is only 1% more than that of existing plants without treatment. (Kreager-FIRL)

PAPER MAKING WASTE-WATER PURIFICATION - BY FLOCCULATING, SEPARATING FIBRES FROM FLOCCULATE, ADDING FILTER AID, AND FILTERING SUSPENSION.
French Patent FR 2277-779. Issued March 12, 1976. Derwent French Patents Abstracts, Vol. X, No. 18, p D3, June 9, 1976.

Descriptors: *Patents, *Pulp and paper industry, *Waste water treatment, *Solid wastes, *Flocculation, *Filtration, *Industrial wastes, Byproducts, Centrifugation, Waste treatment, Pulp wastes, Symbiosis, *Pulp wastes.

A patent for a process to remove solids from waste water generated during paper production is described which provides for using pulp wastes as a filter aid. The process consists of the following steps: subjecting the waste water to flocculation, separating the flocculate, dividing the flocculate into a fibrous mass and a fiber-free suspension of waste material in water, adding a filter aid to the suspension which consists of material removed mechanically from the paper pulp prior to paper preparation, and separating the solid waste material from the suspension by filtering or centrifuging. The process also recovers fibers for addition to the pulp. (Kreager-FIRL)

COAGULATION OF TEXTILE WASTE WATER,
Vanderbilt Univ., Nashville, Tenn. Dept. of Environmental and Water Resources Engineering.
M. Olthof, and W. W. Eckenfelder.
Textile Chemist and Colorist, Vol 8, No 7, p 18-22, July, 1976. 8 tab, 11 ref.

Descriptors: *Textiles, *Color, *Coagulation, *Waste water treatment, *Sludge treatment, *Chemical oxygen demand, Organic compounds, Lime, Sulfates, Evaluation, Performance, Chemical wastes, Industrial wastes, Efficiencies, Economics.
Identifiers: Alum, Ferric sulfate, Textile finishing.

Coagulation techniques employing ferric sulfate, alum, and lime were evaluated in terms of their potential for removing color from mixed waste water generated by four textile finishing mills. The color content in the waste water was reduced by 80-90% when coagulation with ferric sulfate or alum was employed. Lime yielded a supernatant with a higher residual color content, and the required dosage was 1.5-4 times as high as the dosages for ferric sulfate and alum. Lime sludge was the most easily handled, while alum sludge was the most troublesome. For equivalent color removal, lime was slightly more economical than ferric sulfate and significantly more economical than alum. The most economical system was that in which lime or ferric sulfate was employed, depending on the effluent criteria. Lime resulted in an effluent with higher residual color and a high pH. Coagulation also resulted in the removal of between 30-60% of the organics (expressed as chemical oxygen demand) in waste water at optimum dosages for color removal. (Kreager-FIRL)

ZERO DISCHARGE AS EXEMPLIFIED BY TEXTILE DYEING AND FINISHING,
Clemson Univ., S. C. Coll. of Industrial Management and Textile Science.
J. J. Porter. and C. Brandon.
Chemtech, p 402-407, June, 1976. 9 tab, 5 ref.

Descriptors: *Textiles, *Dyes, *Waste water treatment, *Water reuse, *Filtration, Pilot plants, Reclamation, Evaluation, Performance, Symbiosis, Chemical oxygen demand, Color, Conductivity, Solid wastes, Economics, *Recycling, Treatment facilities.
Identifiers: Zero discharge(Textiles industry).

Hyperfiltration was successfully demonstrated on a pilot plant scale as being capable of renovating composite waste water from a textile dyeing and finishing plant. Both the purified product and concentrated residue from treatment of the composite waste with four commercial membrane modules were reused in production dyeings. The product water was satisfactory for use in all the dyeing operations for water recoveries up to 90%. Detailed performance data which include the average rejection percentage for total solids, color, conductivity, and chemical oxygen demand are tabulated for the following types of hyperfiltration membrane materials: polyamide, cellulose acetate in two different configurations, and zirconium(IV)-polyacrylic acid. Cost estimate comparisons are given for different membrane configurations. (Kreager-FIRL)

TANNERY WASTE MANAGEMENT, (LITERATURE REVIEWS),
Cincinnati Univ., Ohio. Dept. of Environmental Engineering.
J. D. Eye.
Journal Water Pollution Control Federation, Vol 48, No 6, p 1280-1282, June, 1976. 15 ref.

Descriptors: *Reviews, *Bibliographies, *Tannery wastes, *Legal aspects, *Waste water treatment, *Reclamation, *Biological treatment, *Sludge treatment, Dewatering, Model studies, Aeration, Suspended solids, Chemical oxygen demand, Color, Sulfides, Lime, Evaluation, Performance, Industrial wastes, Chemical wastes.
Identifiers: Chrome, Tanneries.

A survey of literature dealing with the management of tannery wastes is presented. Topics covered include: legislation affecting tannery discharges; methods for reducing the amount of chrome in tannery effluent; laboratory studies involving the reuse of lime-sulfide unhairing liquors; laboratory procedures for recovering sulfide from unhairing liquors; studies of the biodegradation of chrome tannery wastes in extended aeration units; methods for reducing color, chemical oxygen demand, and total suspended solids in vegetable tanning effluents; the development of mathematical models for biological oxidation and sludge dewatering processes as applied to tannery wastes; and an assessment of the effectiveness of various aeration techniques for the oxidation of tannery wastes. (Kreager-FIRL)

SOME WASTE TREATMENT PROBLEMS IN THE HIDE AND LEATHER INDUSTRIES,
H. W. Young.
Leather Manufacturer, Vol 93, No 6, p 12, 15, 16, 18, 20, 22, 24, 28-31, June, 1976.

Descriptors: *Tannery wastes, *Waste water treatment, *Sludge treatment, *Separation techniques, *Dewatering, *Flocculation, Industrial wastes, Chemical wastes, Solid wastes, Emulsions, Organic compounds, Sulfides, *Industrial wastes.

Water pollution problems associated with chrome and vegetable tanning operations are discussed along with methods for their control. Topics covered include: the use of bar screens, Stehling screens, and other coarse screens to prevent the heavy debris from reaching pumps; problems associated with the plugging of pumps by matted hair and heavy hair burn liquors; the selection of final screening devices; the use of clarification for the separation of grease and solids; the effectiveness of flocculants for breaking grease emulsions; problems associated with the packing tendency of tannery sludges; the success of various methods for dewatering sludge from chrome leather tanneries; methods for the control of final effluent pH; and methods for reducing organic pollutant load and sulfide concentration in vegetable tanning waste streams. (Kreager-FIRL)

RECENT DEVELOPMENTS IN TANNERY EFFLUENT DISPOSAL,
Rhodes Univ., Grahamstown (South Africa). Leather Industries Research Inst.
V. Every, L. S. Dorrington, D. E. Rawlings, D. R. Woods, and D. R. Cooper.
The Journal of the American Leather Chemists Association, Vol 71, No 6, p 276-287, June, 1976. 5 fig, 2 tab, 4 ref.

Descriptors: *Tannery wastes, *Waste water treatment, *Biological treatment, *Activated sludge, Industrial wastes, Chemical wastes, Oxygen demand, Pilot plants, Sulfides, Aeration, Performance, Evaluation, Treatment facilities, Lime.
Identifiers: Tanneries.

Recent developments in the treatment of tannery effluents are reviewed, with particular emphasis on aerobic activated sludge processes. Pilot plant studies indicate that surface aeration of tannery beamhouse liquor acidified to a pH of 9.0 results in an average oxygen demand removal of 76% for a 20-hour retention time without sludge return. Additional experiments indicate that lime usage can be brought down to 2% of hide weight, with the result being that a surface aerator is able to reduce the pH of the beamhouse effluent to approximately 8.0 in a 24-hour retention balancing tank with no addition of acid or manganese catalyst. The reduction of lime usage under these conditions not only eliminates the need for acid addition and flue gas treatment to achieve the proper pH but also results in sulfide removal without the use of a manganese catalyst. Results are also presented for studies on the effect of sludge age and retention time on t purification of fellmongery lime-sulfide effluent a completely mixed activated sludge react (Kreager-FIRL)

ADSORBENT MATERIAL FOR PURIFYING DUSTRIAL EFFLUENTS BY PRECIPITATI BASIC NITROGENOUS POLYMER ON SU PORT USING ACTIVATED MINERAL CLAY
French Patent FR 2284-567. Issued May 14, 19
Derwent French Patent Abstracts, X(26).D2, gust 1976.

Descriptors: *Patents, *Adsorption, *Waste tr ment, *Waste water treatment, *Industrial was Tannery wastes, Pulp wastes, Chemical was Pulp and paper industry, Chemical industry, T tiles.
Identifiers: Activated mineral clay.

A patent has been issued for an adsorbent mat useful in the purification of industrial efflu from the textile, paper, leather, or dye manu turing industries. The material is prepared by precipitation of a basic, nitrogen-contai polymer on a support material by means of ar tivated mineral clay. The adsorbent is used t fect purification by either a mixing operatio use of a fixed bed. This method is cheaper thar rification of similar effluents with traditional culating agents. (Kramer-FIRL)

NEW BEAMHOUSE DEVELOPMENT TO S PLIFY TANNERY WASTE WATER MANA MENT,
Instituut TNO voor Leder en Schoenen, Waal (Netherlands).
P. J. Van Vlimmeren.
The Journal of the American Leather Che Association, Vol. 71, No. 7, p 318-335, July, 6 fig, 8 tab, 13 ref.

Descriptors: *Waste treatment, *Indu wastes, *Chemical wastes, *Waste water t ment, *Tannery wastes, *Organic wastes, plants, Sludge, Byproducts.
Identifiers: Beamhouses.

A summary is presented of new developme the management of tannery waste waters, pa larly organic pollution arising from beamh operations. At TNO in The Netherlan completely new beamhouse system has bee plemented, in which the special treatment residual soak and unhairing liquors from ch leather manufacture led to a dramatic decre the organic pollution load. A sludge bypr with attractive handling properties may also b tained. Both laboratory and pilot plant sca periments have been performed and the pr has been adapted to several Dutch tanneries scale. (Kramer-FIRL)
W76-12427

EFFECT OF WET-AIR OXIDATION ON CHEMICAL COMPOSITION OF SEW SLUDGES,
Purdue Univ., Lafayette, Ind. Dept. of Agro
L. E. Sommers, and E. H. Curtis.
Available from the National Technical Inf tion Service, Springfield, Va 22161, as PB-25 $3.50 in paper copy, $3.00 in microfiche. P University Water Resources Research C Technical Report No. 78. August 1976. 16 p 4 tab, 6 ref. OWRT A-045-IND(1).

Descriptors: *Sewage sludge, *Sewage dis Fertilizers, Sewage treatment, *Waste wate ment, Oxidation, Nitrogen, Denitrification, reuse, Recycling, Chemical properties, Sam Identifiers: *Wet-air oxidation, *Sewage chemical composition, Land application(S sludge).

Sewage sludge samples were obtained from waste streams in two sewage treatments before and after wet-air oxidation. Wet-air oxidation resulted in a 0 - 20% reduction in volatile solids. Concurrently, total N levels in the sludges decreased by >50% while P, Cu, Zn, Ni, Cd and Pb concentrations either increased or remained unchanged. From the standpoint of applying sewage sludge to agricultural land, inclusion of a wet-air oxidation unit in a treatment plant will decrease the desirability of utilizing sewage sludge as a fertilizer material.

vailable from the National Technical Informaon Service, Springfield, Va 22161 as PB-257 842, .00 in paper copy, $3.00 in microfiche. Compleon Report, August 1976. 35 p, 15 fig, 13 tab, 7 ref. WRT A-046ARIZ(1), 14-34-0001-6003.

escriptors: *Sewage effluents, Waste ater(Pollution), *Activated sludge, *Leaching, Solvent extractions, Froth flotation, *Ion change, *Foam fractionation, Tertiary treatent, Waste water treatment, Copper, Molybnum, Industrial water.
entifiers: *Municipal waste water, *Agitation aching, *Copper ore processing, Copper covery, Molybdenum recovery, Metal recovery.

econdary treated sewage effluent was substituted r normal process water in laboratory tests simuing the unit operations of agitation leaching, solnt extraction and froth flotation applied to pper ores. The combined processes of agitation aching followed by solvent extraction were not versely affected by sewage effluent. However, oth flotation recovery of copper and molybnum sulfides showed significant detrimental sponse to sewage effluent. First, a voluminous, fficulty controlled froth was generated, even in e absence of a frothing agent, that has little neral carrying ability. Second, sewage effluent used a small loss in copper recovery and a large s in molybdenum recovery. The detrimental efts of sewage effluent on flotation were partially ercome by tertiary treatment of the effluent by ivated carbon adsorption and anion exchange. e frothing problem was significantly reduced er treating the sewage effluent by foam fracnation. Dilution of the effluent with normal ocess water resulted in a significant improvent in metal recovery. In addition, the large loss olybdenum recovery was overcome by using a ondary collector in a combination reagent edule. However, the secondary collector sed an appreciable loss in copper recovery.

TER POLLUTION CONTROL IN THE ANDINAVIAN COUNTRIES,
ional Water Board of Finland, Helsinki.
Haverinen, and K. Noukka.
uropa, No. 20, p 14-17, 20, 1974. 5 illus, 8 ref.

criptors: *Water pollution control, Europe, reign countries, *Pulp and paper industry, te treatment, *Waste water treatment, *Pulp tes, Sulfite liquors, Water reuse, Legislation, unicipal wastes, Sewage treatment, Water ity control, Water pollution sources, Wastes, dustrial wastes, Sulfite liquors.
ntifiers: *Sweden, *Finland, Scandinavia, ite mills.

extent of water pollution in Finland and den is described, and municipal sewage treatt programs in both countries are reviewed fly. Water pollution control in the Scandinavipulp and paper industries is discussed. In den, small polluting sulfite mills have been aced with modern facilities featuring extensive ution control. All but two of Finland's 33 pulp mills recover their spent pulping liquors. (One of these two mills will be closed shortly, and the other is installing facilities to burn the waste liquor). Emphasis in both countries is on reuse and recovery of waste waters. Some aspects of the environmental protection agreement between Finland and Sweden are Discussed. (Witt-IPC)

MILL EFFLUENT TREATMENT AND FIBER RECOVERY.
Effluent and Water Treatment Journal, Vol. 15, No. 12, p 633, December, 1975. 1 fig.

Descriptors: *Waste water treatment, *Flotation, *Pulp wastes, Wastes, *Industrial wastes, Water pollution treatment, Water pollution sources, Water pollution control, Waste treatment, Screens, Polyelectrolytes, Flocculation, Water purification, Water quality control.
Identifiers: *Fiber recovery, Thames River(England), Kraft mills.

Effluent from Kent Kraft Mills in Northfleet (England) flows through a closed culvert to a sump where coarse tramp material is removed by a manually raked bar screen. The effluent is then dosed with a polyelectrolyte flocculant (not specified) and pumped to an adjacent 30-ft diameter dissolved air flotation unit. The fiber flocs on the surface are removed and returned to the hydrapulper. Clarified effluent is discharged to a second sump and then to the River Thames. Grit from the air flotation unit is discharged into the feed sump for periodic removal by the sludge gulper. The mill produces kraft sack papers from both kraft waste paper and unbleached fresh kraft pulp. (Witt-IPC)

PHENOLIC AND CHLOROPHENOLIC OLIGOMERS IN CHLORINATED PINE KRAFT PULP AND IN BLEACH PLANT EFFLUENTS,
State Univ. of New York at Syracuse. Coll. of Environmental Science and Forestry.
M. Erickson, and C. W. Dence.
Svensk Papperstidning, Vol. 79, No. 10, p 316-322, June 20, 1976. 2 fig, 17 ref, 4 tab.

Descriptors: *Pulp wastes, *Bleaching wastes, *Phenols, Wastes, *Industrial wastes, Water pollution sources, Chlorine, Oxidation, Potassium compounds, Gas chromatography, Mass spectrometry, Lignins, Softwood, Water pollution, Alkalis(Bases), Separation techniques, Organic acids, Organic compounds, Aromatic compounds, *Chlorination, *Waste water treatment, Pollutant identification.
Identifiers: Alkaline extraction, Potassium permanganate, Kraft pulp, Hydrochloric acid, Kappa-number, Kraft mills, Chlorophenols.

Softwood kraft pulp (kappa-number 28.2) was chlorinated with 3.6 and 6.0% applications of chlorine, washed with dilute HC1, and extracted with alkali. The undiluted spent chlorination and alkaline-extraction liquors and the corresponding pulps were oxidized with potassium permanganate to convert the oligomeric phenolic residues contained in them to monomeric aromatic carboxylic acids which were then identified using gas-chromatographic and mass-spectrometric techniques. In the spent chlorination liquors 11 phenolic compounds were detected. Combined yields of their oxidation products indicated a concentration of about 10 ppm for phenolic residues in each of the 2 original liquors (from 3.6 and 6% chlorine). Mono-, di-, and trichloro-substitution was observed on what were originally uncondensed lignin oligomers in the liquors. The presence of 5- and 6-linked condensed phenolic units containing from nil to 2 chloro substituents per phenolic ring was also confirmed. In the spent caustic extraction liquors 13 phenolic compounds were positively or tentatively identified. The estimated total concentration of phenolic substances was about 100 ppm in the liquor from 6%- chlorinated pulp, but much higher (ca. 190 ppm) in the liquor from the 3.6%-chlorinated pulp. The chlorinated pulps contained the same kinds of phenolic compounds as did the spent chlorination liquors, but in higher concentrations. Permaganate oxidation of alkali-extracted pulp indicated that the combination of chlorination plus caustic extraction had removed all but traces of phenolic substances. (Brown-IPC)

REMOVAL AND RECOVERY OF PHENOLS FROM INDUSTRIAL WASTE EFFLUENTS WITH AMBERLITE XAD POLYMERIC ADSORBENTS,
Rohm and Haas Co., Philadelphia, Pa.
E. H. Crook, R. P. McDonnell, and J. T. McNulty.
Industrial and Engineering Chemistry, Product Research and Development, Vol. 14, No. 2, p 113-118, June 1975. 10 fig, 3 ref, 3 tab.

Descriptors: *Phenols, *Waste water treatment, *Ion exchange, Effluents, Water pollution sources, Wastes, Industrial wastes, Separation techniques, Waste treatment, Resins, Organic compounds, Aromatic compounds, Chemical wastes, Chemicals, Water pollution treatment, Water quality control, Water pollution control.
Identifiers: *Amberlite ion exchange resins, Bisphenol A, p-Nitrophenol, Acetone, Methyl alcohol, Ethyl alcohol.

Industrial waste effluents containing 280-6700 ppm of phenol, condensed phenol (bisphenol A), or substituted phenol (p-nitrophenol) were passed through columns containing Amberlite XAD polymeric sorbents in order to remove the phenolic compounds. Using Amberlite XAD-4, a total of 87 g/liter of phenol was removed from a waste effluent containing 6700 ppm of phenol; the resin column allowed less than 1 ppm of phenol leakage. Regeneration of the resin was effected by an acetone or methanol treatment. Acetone (for recycle in the regeneration step) and phenol (99% purity) were recovered by distillation. Bisphenol A (BPA) may be removed from a waste stream (280-910 ppm of BPA) by passage through columns of Amberlite XAD-4 and XAD-7. The capacity of XAD-4 and XAD-7 for BPA was 34 and 16 g/liter,

respectively. The resin was efficiently regenerated (95-100%) with 4% NaOH. p-Nitrophenol (1248 mg/liter) was removed from an industrial waste stream by passage of the effluent through a bed of Amberlite XAD-7. The resin had a capacity of 40 mg/liter at breakpoint of 7.0 mg/liter. The resin was efficiently regenerated with ethanol. (Witt-IPC)

FIRST CLOSED-CYCLE KRAFT MILL,
L. Haas.
Pulp and Paper International, Vol. 18, No. 6, p 35-36, 53, June, 1976. 1 fig, 1 illus.

Descriptors: *Pollution abatement, *Pulp wastes, *Bleaching wastes, Water pollution sources, Wastes, Industrial wastes, Operating costs, Water consumption(Except consumptive use), Pulp and paper industry, Salts, Sodium chloride, *Recycling, Waste treatment, *Waste water treatment, Costs, *Water reuse.
Identifiers: *Kraft mills, Closed-cycle systems, Great Lakes Paper Co.(Canada), Rapson-Reeve salt recovery process, Chemical recovery, Energy conservation.

Great Lakes Paper Company is adding a new 225,000 metric ton/year bleached kraft mill to its existing facilities at Thunder Bay, Ontario. It will feature the first commercial installation of the Rapson-Reeve salt recovery process, in which NaCl is removed from the black liquor cycle. The recovered salt is used in the regeneration of bleaching chemicals. Complete recycling of pulping and bleaching process wastes will eliminate the effluent treatment plant and reduce water and energy consumption and operating cost. A brief description and flow diagram of the salt recovery process are given. (Witt-IPC)

SWISS MILL IS TRYING WET AIR OXIDATION TO GET RID OF SLUDGE AND RECOVER FILLER,
Zimpro Inc., Rothschild, Wis.
B. L. Flynn, Jr.
Paper Trade Journal, Vol. 160, No 9, p 23-24, May 1, 1976. 3 fig.

Descriptors: *Sludge treatment, *Pulp wastes, *Oxidation, Pulp and paper industry, Pigments, Clays, Waste treatment, Water pollution sources, Wastes, Industrial wastes, Carbon dioxide, Inorganic compounds, Water, Europe, Wisconsin, Foreign countries, Treatment facilities, Kaolinites, Titanium, Air, Aeration.
Identifiers: Kaolin, Titanium dioxide, Fillers, Chemical recovery, *Switzerland, *Wet air oxidation.

In 1977, Papierfabrik Biberist (Switzerland), a fine-papers mill, will start up the world's first commercial unit for the recovery of filler clay and pigment from paper mill sludge by wet air oxidation. In the system, built by Zimpro Inc., raw sludge at a concentration between 7 and 8% will be pumped to the oxidation unit at a pressure of 2500 psig. A multistage reciprocating air compressor will supply air at the same pressure, and the sludge and air mixture will be taken into the pressure vessel through heat exchangers. Almost 90% of the organic material in the sludge is oxidized in the reactor to carbon dioxide and water. The rest is solubilized. Oxidized products are drawn off through the process heat exchanger and cooled. The insoluble organic material is removed from the sludge, leaving behind the inorganic materials, primarily kaolin and titanium dioxide. (Sykes-IPC)
W76-12489

MONADNOCK CLEANS UP: SPECIALTY PAPER MILL INSTALLS $1-MILLION WASTE TREATMENT SYSTEM.
Paper Trade Journal, Vol. 160, No. 9, p 28-29, May 1, 1976. 1 fig, 1 tab.

Descriptors: *Pulp wastes, *Waste water treatment, *Treatment facilities, Wastes, Industrial wastes, Water pollution sources, Water pollution treatment, Water purification, Suspended solids, Biochemical demand, Aerated lagoons, Aeration, Settling basins, Tertiary treatment, Water quality control, Water pollution control, Waste treatment, *New Hampshire.
Identifiers: Dorr-Oliver Clariflocculator, Contoocook River(NH).

Waste treatment at Monadnock Paper Mills Inc., Bennington, New Hampshire, which produces about 80 tons/day of graphic arts and technical papers, includes primary chemical-physical clarification, secondary biochemical treatment, and tertiary clarification. Effluent is pumped from the treatment plant's surge chests to the primary treatment system consisting of a Dorr-Oliver Clariflocculator equipped with a center drive sludge rake assembly and skimmer. Almost all of the settleable solids and about 94% of the total suspended solids, as well as approximately 30% of the BOD, are removed in the clarifier. The overflow from the clarifier is gravity-fed either in series or in parallel through two identical 2,500,000 gallon aeration ponds. After secondary treatment the effluent flows by gravity to a tertiary system consisting of two 1,500,000 gallon settling ponds. The effluent is mixed with air to ensure complete saturation with oxygen before being discharged into the Contoocook River Since this facility began operating in July 1974, the mill has surpassed 1978 Environmental Protection Agency requirements. (Sykes-IPC)
W76-12490

CONTAINER CORP. BOXBOARD PLANT INSTALLS CLARIFICATION, SLUDGE RECYCLING SYSTEM.
Paper Trade Journal, Vol. 160, No. 8, p 54, April 15, 1976.

Descriptors: *Activated sludge, *Waste water treatment, *Treatment facilities, *Pulp wastes, Wastes, Industrial wastes, Waste treatment, Water pollution sources, Water pollution treatment, Water pollution control, Florida, Water purification, Sludge treatment, Dewatering, Incineration, Waste disposal, Equipment.
Identifiers: *Board mills, Dorr-Oliver clarifier, Unox process, Dorr-Oliver RSR(Rapid sludge removal) clariflocculator, Emmerson-Jones filter press.

The activated sludge system installed by Container Corporation of America (Fernandian Beach, Florida) is capable of handling over 25,000,000 gal/day of combined process waste streams. The combined plant wastes are initially processed in a 250-ft diameter Dorr-Oliver primary clarifier. Primary clarifier effluent is fed to a Union Carbide 'Unox' oxygen dissolution system, a three-bay structure with a capacity of about 2,500,000 gallons. Mixed liquor goes to two Dorr-Oliver RSR Clariflocculators, each of which features a flocculator influent well. The influent well promotes floculation and increases the settling rate and detention efficiency. The underwater parts of both clarifiers are designed with standard RSR (rapid sludge removal) configuration. Rake arms are equipped with sludge uptake pipes and alternate rate and deflector blades. Waste sludge from the clarifiers is dewatered on two Emmerson-Jones filter presses. Sludge cake is metered to bark burners for disposal. (Sykes-IPC)
W76-12491

PAPER MILL WASTE SLUDGE OXIDATION AND PRODUCT RECOVERY,
Sterling Drug, Inc., New York. (Assignee).
C. A. Hoffman.
United States Patent No. 3,876,497. April 8, 1975, 4 p. 2 fig, 2 claims.

Descriptors: *Pulp wastes, Sludge, *Oxidation, organic compounds, Wastes, Industrial wa Water pollution sources, Clays, Dewate *Sludge treatment, Heat treatment, Pigm Titanium, *Patents.
Identifiers: Paper fillers, Titanium dio *Sludge oxidation.

A process for recovering inorganic paperma fillers (titanium dioxide and clay) from pape waste sludge comprises heating the sludge wi oxygen-containing gas at 160-375C and 500 lb/sq inch, so that most of the water content sludge remains in the liquid phase, for 0.25-5 separating the gas, liquid, and osolid phases washing and dewatering the solids to pr recovered filler suitable for reuse in the pape ing process. (Lynch-IPC)

USGS-WRSIC 76-001 U. S. DEPT. OF I. URBANA-CHAMPAIGN

PROCESS FOR TREATING WASTE WATERS FROM ALKALINE PULPING (PROCEDES DE TRAITEMENT DES EAUX RESIDUELLES DE FABRICATION DES PATES DE CELLULOSE PAR DES METHODES ALCALINES),
A. Vian Ortuno, and J. Rodriguez Jimenez.
French Patent No. 2,169,835. September 14, 1973, 8 p. 10 claims.

Descriptors: *Waste water treatment, *Pulp wastes, *Chemical precipitation, *Coagulation, Organic compounds, Waste treatment, Color, Oxidation, Neutralization, Mixing, Acids, Hydrogen ion concentration, Water pollution sources, Water pollution treatment, Wastes, Industrial wastes, *Patents.
Identifiers: *Black liquors, Kraft mills.

A process for treating dilute black liquors from alkaline pulping involves mixing them with enough strong acid to lower their pH to below 6.5, thus precipitating nearly all of the nonbiodegradable organic material via coagulation. This material is then separated from the liquid. The liquid is then subjected to complementary treatment involving sorptive decoloration, atmospheric oxidation, and neutralization to meet discharge requirements. (Speckhard-IPC)
W76-12497

IMPROVEMENTS TO PROCESSES FOR PURIFYING EFFLUENTS ORIGINATING FROM THE MANUFACTURE AND BLEACHING OF CHEMICAL OR SEMICHEMICAL PAPERMAKING PULPS (PERFECTIONNEMENT AUX PROCEDES D'EPURATION DES EFFLUENTS PROVENANT DE LA FABRICATION ET DU BLANCHIMENT DES PATES A PAPIER DITES CHIMIQUES OU SEMI-CHIMIQUES),
J. Bebin, P. Boulenger, and J.-C. Bourdelot.
French Patent No. 2,159,560. June 22, 1973, 11 p. 2 fig, 2 tab, 5 claims.

Descriptors: *Waste water treatment, *Pulp wastes, *Bleaching wastes, *Chemical precipitation, *Flocculation, Waste treatment, Separation techniques, Hydrogen ion concentration, Water purification, Water pollution treatment, Wastes, Industrial wastes, Aluminum, *Patents.
Identifiers: *Aluminum sulfate.

A process for purifying pulp mill waste waters and bleach plant effluents is claimed, in which part of the nonbiodegradable materials present in the process water are precipitated in a primary stage by adddition of excess aluminum sulfate. The solution obtained after separation of the precipitate is subjected in a second stage to flocculation by the excess aluminum sulfate remaining in solution, with adjustment of pH to about 5.4. The precipitates and flocculant material formed in the two stages are separated and treated to allow the recovery of aluminum sulfate. (Sykes-IPC)
W76-12498

AEROBIC LAGOON WASTE TREATMENT AND METHOD,
Kimberly-Clark Corp., Neenah, Wis. (Assignee).
J. R. Le Compte, Jr., and D. W. Appel.
United States Patent No. 3,893,924. July 8, 1975, 9 p. 5 fig, 6 claims.

Descriptors: *Aerated lagoons, *Waste water treatment, *Pulp wastes, Circulation, Jets, Suspended solids, Electric power demand, Aeration, Waste treatment, Water pollution treatment, Wastes, Industrial wastes, Aerobic treatment, Patents, Oxidation lagoons.

A system for treating liquids containing waste materials, such as paper mill effluents, includes a basin or lagoon which is operated aerobically by the use of jets arranged so as to set up cells of complementary primary circulation with resulting secondary circulation patterns sufficient to prevent solids from settling out, except when desired in a settling zone. Power requirements are reduced as compared to those of conventional surface-aerated or diffuser-aerated lagoons equipped to operate aerobically. (Lynch-IPC)
W76-12499

PROCESS FOR TREATMENT OF PAPER PULP-CONTAINING EFFLUENTS (VERFAHREN ZUR BEHANDLUNG VON PAPIERBREIHALTIGEN ABFALLFLUESSIGKEITEN),
Nippon Carbon Co. Ltd., Tokyo.
M. Nakajima, and K. Kuwabara.
German Patent (Offenlegungsschrift) No. 2,505,744. September 25, 1975, 17 p. 4 tab, 4 claims.

Descriptors: *Pulp wastes, *Waste water treatment, *Flocculation, *Chemical precipitation, Waste treatment, Water pollution sources, Water pollution treatment, *Patents.
Identifiers: *Dicyandiamide-formaldehyde resins, *Aluminum sulfate.

This process for paper mill effluent treatment is based on the use of dicyandiamide-formaldehyde resin as a flocculant in amounts of 1-50 weight parts per 100 weight parts of turbid substances. Addition of the flocculant is followed by addition of aluminum sulfate. (Speckhard-IPC)

PROCESS FOR SEPARATING CELLULOSE FROM WASTE WATER (VERFAHREN ZUR BEFREIUNG VON ZELLULOSE AUS ABWAESSERN),
Mo Och Domsjo A.B., Ornskoldsvik (Sweden).
H. O. Samuelson.
German Patent (Offenlegungsschrift) No. 2,501,719, July 31, 1975, 38 p. 2 fig, 20 claims.

Descriptors: *Bleaching wastes, *Pulp wastes, *Waste water treatment, *Anion exchange, Organic compounds, *Sorption, *Polymers, Sulfates, Chlorides, Ions, Effluents, Organic acids, Chlorination, Aromatic compounds, Alkalis(Bases), Resins, *Cellulose, Waste treatment, Wastes, Industrial wastes, Water pollution treatment, Ion exchange, Oxygen, *Patents.
Identifiers: Alkaline extraction, Oxygen bleaching, Chlorine dioxide.

A process is claimed for separating organic substances from pulp mill effluents through sorption on water-insoluble polymers (preferably cross-linked polymers) and for recovering these substances. The process is characterized in that a portion of the effluent with a low content of inorganic anions, such as sulfate and chloride ions (e.g., the effluent from an alkaline extraction stage or an oxygen bleaching stage), is brought into contact with one or more organic anion exchangers to remove all organic acids or anions and to adsorb organic nonelectrolytes while another portion of the effluent (preferably with a high chloride content, such as the effluent from chlorination or chlorine dioxide bleaching), is brought into contact with an adsorbing resin with a structure such that aromatic compounds are adsorbed while the chloride ions remain in solution. Following the sorption stage, the anion exchanger is regenerated with a solution containing active alkali, the solution being additionally used, wholly or partly and preferably following regeneration, in the desorption of materials adsorbed by the adsorption resin.(Speckhard-IPC).
W76-12502

APPARATUS, INSTALLATION, AND PROCESS FOR DEWATERING CLARIFIED SLUDGES (VORRICHTUNG, ANORDNUNG UND VERFAHREN ZUR ENTWAESSERUNG VON KLAERSCHLAEMMEN),
Voit, Michael, Fa., Weissenstadt, (West Germany).
K. Voit.
German Patent (Offenlegungsschrift) No. 2,320,494. November 7, 1974, 9 p. 4 fig, 7 claims.

Descriptors: *Sludge treatment, *Dewatering, *Filters, *Pulp wastes, Wastes, Industrial wastes, Water pollution sources, Screens, Size, Waste treatment, Solid wastes, Sludge, Operation and maintenance, Filtration, Water pollution treatment, Fibers(Plant), *Patents.
Identifiers: *Vacuum drum filters.

A vacuum drum filter for dewatering sludges with a component of fibrous materials (e.g., paper mill sludge) is characterized by the use of a filter drum with a metal screen of relatively coarse mesh (mesh openings larger than the diameter of the fibers in the sludge but smaller than the length of most of the fibers) tightly stretched around the drum periphery. Use of such a screen in place of a relatively fine textile filter material permits uninterrupted operation with the same filtering element over periods of several years while giving a satisfactory filtering effect. (Speckhard-IPC)
W76-12503

PROCESS FOR PRECLEANING INDUSTRIAL WASTE WATER RESULTING FROM THE PROCESSING OF WATER-SOLUBLE PHENOLIC RESINS OR UREA-FORMALDEHYDE RESIN SOLUTIONS (VERFAHREN ZUR VORREINIGUNG VON BEI DER VERARBEITUNG VON WASSERLOESLICHEN PHENOLISCHEN RESOLEN ODER VON HARNSTOFF-FORMALDEHYDHARZLOESUNGEN ANFALLENDEM INDUSTRIEABWASSER),
V. Polinek.
German Patent (Offenlegungsschrift) No. 2,335,327. July 18, 1974, 11 p. 5 claims.

Descriptors: *Waste water treatment, *Chemical precipitation, *Phenols, Hydrogen ion concentration, Sedimentation, Polyelectrolytes, Wastes, Industrial wastes, Water pollution sources, Water pollution treatment, Binders, *Patents, *Resins.
Identifiers: Plywood, Wood particle board, Urea-formaldehyde resins, Aluminum sulfate, Aluminum chloride, *Phenolic resins.

A process for pretreatment of effluents from particle board or plywood plants to remove phenolic or urea-formaldehyde resins involves (1) precipitation in a neutral or weakly acidic medium using aluminum sulfate and/or aluminum chloride solutions -- acidified (if necessary) through the addition of inorganic acids; (2) accelerating the sedimentation of the resulting precipitate through addition of synthetic polyelectrolytes, and (3) separating off and recycling the sedimented precipitate. (Speckhard-IPC)
W76-12504

PROCESS FOR PURIFYING PAPERMAKING EFFLUENTS (VERFAHREN ZUR REINIGUNG VON BEI DER PAPIERHERSTELLUNG ANFALLENDEM ABWASSER),
Akzo N.V., Wuppertal (West Germany).
L. O. Barkman.
German Patent (Offenlegungsschrift) No. 2,529,861. January 29, 1976, 12 p. 1 fig, 1 tab, 1 claim.

Descriptors: *Waste water treatment, *Pulp wastes, *Flocculation, *Filtration, *Centrifugation, Wastes, Industrial wastes, Waste treatment, Water pollution treatment, Fibers(Plant), Clays, Sands, Chemicals, Plastics, Films, *Patens.
Identifiers: Waste paper treatment.

A process for purifying effluent from paper machines (especially papermaking involving the reuse of waste paper stock) involves addition of a flocculant, removal of fibrous components from the effluent, addition of a filtration aid, and removal of the remaining solids in the effluent via filtration or centrifugation. In particular, the filtra-

tion aid is the material separated from the pulp prior to papermaking (generally a mixture of waste paper impurities including heavy particles such as sand, clay, and other substances serving as fillers as well as bits of plastic film). (Lynch-IPC)
W76-12505

EFFLUENT TREATMENT PROCESS (ABWASSERAUFBEREITUNGSVERFAHREN),
Hitachi Ltd. (Japan).
T. Kobayashi, M. Yuasa, and M. Itoh.
German Patent (Offenlegungsschrift) No. 2,344,587. April 18, 1974, 23 p. 1 fig, 3 tab, 3 claims.

Descriptors: *Waste water treatment, *Wood wastes, *Suspended solids, *Adsorption, Waste treatment, Water pollution sources, Heavy metals, Dyes, Detergents, Sawdust, Farm wastes, Water pollution treatment, Water pollution control, Industrial wastes, *Patents, *Biological treatment, Mixing.

A process for biological treatment of industrial effluents includes mixing the effluent with fully developed tissue cells of seed plants (e.g., sawdust, comminuted wood, or agricultural waste). Substances such as heavy metals, dyes, and detergents are effectively adsorbed by the tissue cells and are separated from the waste water when the tissue cells are removed. (Speckhard-IPC)
W76-12506

PROCESS FOR PURIFYING INDUSTRIAL EFFLUENTS (VERFAHREN ZUR REINIGUNG VON INDUSTRIELLEN ABWAESSERN),
CIBA-GEIGY Ltd., Basel (Switzerland).
H. Wegmuller, and J. Haase.
German Patent (Offenlegungsschrift) No. 2,365,559. July 10, 1975, 35 p. 10 claims.

Descriptors: *Waste water treatment, *Pulp wastes, *Adsorption, *Color, Wastes, Industrial wastes, Textiles, Dyes, Water purification, Water pollution treatment, *Solid contact processes, Sorption, *Cellulose, Waste treatment, *Patents, Polymers.
Identifiers: Leather, Waste paper, Aminoplast resins, Adsorbents, *Decoloring.

A process for purifying (especially decoloring) industrial effluents (e.g., from the textile, paper, leather, or dyeing industries) involves contacting the waste water with a cellulosic adsorbent material (pulp, waste paper) pretreated with a basic polymeric precipitating agent (e.g., a water-soluble basic aminoplast). (Speckhard-IPC)

Vestsi Akademii Navuk Belaruskai SSR, Seriya Fizika-Energetychnykh Navuk, No. 4, p 38-41, 1974. 1 fig, 10 ref.

Descriptors: *Radiation, *Gamma rays, Effluents, Oxygen, Oxidation, Water pollution sources, Wastes, Industrial wastes, *Waste water treatment, Water pollution treatment, *Radiation, *Irradiation.
Identifiers: *Black liquors, Hydrogen peroxide, *Radiolysis.

Redistilled water saturated with air and kraft black liquor diluted with 500 volumes of water saturated with air were irradiated with gamma-rays (from Cs-137) at a rate of 65 + or - 1 rad/sec. In the course of irradiation (up to 20 min) determinations were made of the concentration of dissolved oxygen and hydrogen peroxide. For pure water, the radiation yield (positive) of hydrogen peroxide was 1.1 and oxygen (negative) 0.5. For black liquor, the corresponding values were zero and 1.3. The relatively low oxygen radiation yield can be explained by a low rate of oxidation in the system, while the absence of hydrogen peroxide is due either to its reaction with radicals in the solution or its consumption for oxidation of dissolved substances. The experimental radiation yield values are in agreement with values calculated on the basis of generally accepted mechanism of water radiolysis. The high oxygen yield value (3.3) reported for water by Compton in Isotopes and Radiation Technology, Vol. 8, p 453 (1971), close to that obtained by him for an effluent (3.5), was apparently due to the presence of impurities acting as acceptors. The range of oxygen yields, from 1.3 (found in diluted black liquor) to 3.5 (reported by Compton), indicates that the oxygen consumption depends on the nature of polluting substances dissolved in water. Descriptors: *Treatment facilities, *Waste water treatment, *Operation and maintenance, Filters, Filtration, Sedimentation, *Biological treatment, Aerated lagoons, Biochemical oxygen demand, Suspended solids, Leakage, Overflow, *Yeasts, Water pollution sources, Water pollution control, Waste treatment, Wastes, Industrial wastes, Hydrolysis, Effluents, *Fermentation.
Identifiers: USSR.

The effluents of fermentation plants and yeast-producing factories are first purified mechanically in sand filters and radial sedimentation tanks, then subjected to biological purification in aeration tanks or on biological filters. The 5-day BOD of purified effluents is 0.18-1.26 kg/cu m, their content of suspended solids 0.05-0.26 kg/cu m. In most plants, existing purification equipment needs to be expanded and modernized. This should be done by 1980. In the meantime, however, the purification efficiency can be substantially increased by reducing the degree of pollution of the effluents and by improving equipment operation. Thus, pollution can be reduced by controlling losses through leaks and overflow, and by the introduction of biological oxidation in air-float yeast-growing tanks. The operation of the equipment can be improved by better control of various stages of the process and by adequate maintenance. These methods and measures are described and their effects in terms of reduced pollution and higher effluent purification are estimated. (Stapinski-IPC)

COST FUNCTIONS FOR WASTEWATER CONVEYANCE SYSTEMS,
Louvain Univ. (Belgium). Groupe de Travail d'Economie de l'Environnement.
D. Tyteca.
Journal of the Water Pollution Control Federation, Vol. 48, No. 9, p 2120-2130, September 1976. 5 fig, 1 tab, 20 ref.

Descriptors: *Waste water(Pollution), *Water pollution control, Water quality, Economics, *Optimization, *Costs, Mathematical models, Equations, *Regional analysis, *Waste water treatment, Constraints, Hydraulics, Flow, Pipes, Pressure, Gravity, Planning, Numerical analysis, Regression analysis, Linear programming, Systems analysis, Sewers.
Identifiers: *Cost minimization, Nonlinear programming, *Waste water conveyance.

Waste water transportation cost functions are important in regional minimum-cost water-quality control models. These cost functions are elaborated, in a Belgian study, beginning with a description of the installations to be provided and their cost. Hydraulic relationships are obtained in order to derive more useful forms of the total cost. A preoptimization study is conducted to express the cost as a function of the flow. The flow is the decision variable in the regional models, and the cost equations must be clear of the diameter of the pipe. After numerical examples, the applicability of the analysis to larger contexts is discussed, and the role of the cost function as a component of the regional models is recalled. Results indicate that the cost functions of waste water conveyance and treatment are concave--the greater quantities of waste water transported or treated cost less than smaller ones. (Bell-Cornell)

O. G. Lindholm.
Journal of the Environmental Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 102, No EE2, p 301-312, April 1976. 9 fig, 1 tab, 29 ref.

Descriptors: *Water pollution, *Combined sewers, *Environmental engineering, *Storm water, Basins, Retention, Storage tanks, Mathematical models, Storm surge, Runoff, Biochemical oxygen demand, Simulation analysis, Systems analysis, Networks, *Waste water treatment, Treatment facilities.
Identifiers: Receiving water.

Mathematical models for sewer networks and wastewater treatment plants have been used to simulate the BOD levels at different points in the treatment works and to combine sewer overflows under different conditions. The network and the treatment plant were simulated as a unit during an entire year's varying precipitation. Stormwater retention basins proved to be beneficial in reducing total pollution load discharged to the receiving waters only when the degree of pollution in stormwater runoff exceeded a specific limit. However, the effect of a retention basin increased considerably when the storm overflows and the basin outlet flows were set to an optimum setting, and when the size of the secondary clarifier was compatible with the retention basin. The simulations showed that retention basins could have an adverse effect on the discharge of BOD to the receiving water if the amount of BOD is removed by the storm overflow anyway. (Bell-Cornell)

INFLUENCE OF SPECIAL CONSTRUCTIONS IN REGIONAL WASTE WATER SYSTEMS AND THEIR ROLE IN MATHEMATICAL MODELS FOR PLANNING.
Karlsruhe Univ. (West Germany). Institut fuer Hydromechanik, Staunanlagen und Wasserversorgung.
H. Orth.
In: The Use of Computer Techniques and Automation for Water Resources Systems, Washington, D. C., 1974, Volume II, p 36-42. 3 fig, 8 ref.

Descriptors: *Waste water(Pollution), *Treatment facilities, *Planing, *Regional development, Optimization, Methodology, Mathematical models, Pipes, Constraints, Systems analysis, Economics, *Waste water treatment.
Identifiers: Cost minimization, Storm water outlets, Binary optimization.

Regional waste water systems become viable solutions to the problems of waste water management, where we are forced to remove waste water over larger distances because the receiving water situation at the place of origin poses difficulties with the increasing sewage flow. Closely connected with this problem is the claim for higher efficiency and reliability of the sewage treatment plants. This requires both a complicated technology and highly qualified operators, requirements which can usually be realized only at the larger treatment units. From this there frequently follows an economical profit in the construction and operating of a large system. This article discusses mathematical models as an instrument for planning and deals with the dimensioning of special constructions and their consideration by means of the binary optimization technique. Identifiers: *Waste water collection, *Branch-and-bound methods, *Linear binary optimization, Cost minimization, Sewerage systems, Computation time, Computer storage.

The need for planning the process of regional and intercommunity waste water collection and treatment systems is increasing continually in importance with regard to communities, regional water authorities, and civil engineers. Increasing costs oblige the community and design engineer to apply rational methodology for the technical conception as well as for financing. This work presents a computation scheme which allows a determination of the most economical locations of treatment plants and the interconnecting sewerage system so that the regional costs are minimized. The optimal solution is found considering implicitly all possible technical alternatives to a waste water association. Proceeding from a mathematical model which describes the optimization problem, the transformation into a linear binary optimization problem is shown. This problem is more easily solved with certain algorithms than the original non-linear problem. The binary model allows the designer to consider several parameters and thus system components. AVERAGE RISE OF EPA PLANT, SEWER INDEXES SLOWS.
Engineering News Record, Vol. 196, No. 26, p 112, June 24, 1976. 3 tab.

Descriptors: *Waste water treatment, *Activated sludge, *Treatment facilities, *Sewers, *Cost trends, Federal government, Cities, Average costs.
Identifiers: Cost indexes.

Sewer and plant cost indexes compiled by the Federal Environmental protection Agency (EPA) rose from 1% to nearly 3% during the second quarter of 1976. However, the average increase rate for the series of three indexes during this period dropped slightly below the average increase rate for the previous quarter. City indexes for hypothetical facilities were determined for 25 cities. The average for a five-mgd plant increased 1.1% from the first-quarter average; that for a fifty-mgd plant increased 1.8%, and that for complete urban sewer systems increased 2.9%. The increase rates dropped from a first quarter average of 2.7% for a 5-mgd plant and from 2.6% for a 50-mgd plant, but increased from 2% for the sewer system. The 5-mgd hypothetical plant include a bar screen, grit chamber primary clarification, conventional activated sludge, chlorination, gravity thickening and vacuum filtration. The 50-mgd plant include these plus lime clarification and multimedia gravity filtration as well as multiple hearth incineration. Labor considerations in the cost index for the sewer system include common laborers, cement finishers, carpenters, and medium equipment operators. Fringe benefits are included in labor rates. Concrete is ready-mix; pipe is reinforced concrete 24 in. in diameter, lumber is lowest grade, and asphat is assumed to be paving asphalt. Second-quarter averages for old sewage treatment plant and sewer construction cost indexes were 257.8 and 269.7, respectively, up 4.8% and 5.5% respectively, from June 1975. (Snyder-FIRL)
W76-12598

APPARATUS AND PROCESS FOR PRODUCING AN ORGANIC PRODUCT FROM SEWAGE SLUDGE,
Q. L. Hampton.
United States Patent 3,963,471. Issued June 15, 1976. Official Gazette of the United States Patent Office, Vol. 947, No. 3, p 1223-1224, June, 1976. 1 fig.

Descriptors: *Patents, *Sewage sludge, *Organic compounds, *Sludge treatment, *Byproducts, *Waste treatment, Coagulation, Flocculation, Separation techniques, Dewatering, Temperature, *Recycling.

A patent for a process which produces an organic product from sewage sludge is described. The process consists of the following steps: mixing a predetermined quantity of liquid waste sewage sludge with chemicals for coagulating or flocculating the solids contained in the liquid sludge, subjecting the mixture to pressure for the extraction of a portion of the moisture, draining off the extracted moisture, heat drying and pelletizing the detwatered material to produce pellets, subjecting the dry pelletized material to a suction action in order to separate dust and fine particles from the pellets, and discharging the separated pellets by gravity to a storage location. In addition, a portion of the pellets produced are mixed with the dewatered material for drying and preheating prior to the heat drying and pelletizing stages so that the drying temperatures can be selected low enough to prevent formation of clinkers and the ignition of organic material. (Kreager-FIRL)
W76-12600

PROCESS FOR TREATING DECOMPOSABLE ORGANIC WASTE MATERIALS,
L. A. Haug.

United States Patent 3,963,470. Issued June 15, 1976. Official Gazette of the United States Patent Office Vol. 947, No. 3, p 1223, June, 1976.

Descriptors: *Patents, *Sewage sludge, *Organic compounds, *Sludge treatment, *Byproducts, Aeration, Biological treatment, Absorption, *Decomposing organic matter, *Waste water treatment.

A patent for a process that treats decomposable wet sewage sludge in order to produce a partially dry humus-like material is described. The process involves partially drying a portion of the wet material, spreading this portion in the form of an absorbent pad, mixing an additional quantity of sewage sludge with the first portion in order to produce a mixture having an initial moisture content sufficient for the initiation of aerobic decomposition, and periodically turning the mixture under ambient atmospheric conditions in order to aerate it until decomposition ceases and the mixture is partially dry. The steps of wet material addition and aeration (periodic turning) are successively repeated, and a portion of the partially dry humus-like material is removed from the partially dried mixture at predetermined intervals. (Kreager-FIRL)

IMPROVEMENTS IN AND RELATING TO WASTE WATER TREATMENT,
South African Inventions Development Corp., Pretoria. (Assignee).
J. L. Barnard.
United States Patent 3,964,998. Issued June 22, 1976. Official Gazette of the United States Patent Office, Vol. 947, No. 4, p 1722-1723, June, 1976. 1 fig.

Descriptors: *Patents, *Waste water treatment, *Biological treatment, *Activated sludge, *Nitrogen, Organic wastes, Nitrogen compounds, *Denitrification.

A nitrogen removal process for organic waste water containing nitrogenous compounds was patented. Waste water and activated sludge recycled from a subsequent stage are fed to the first biological denitrification stage. Turbulence is induced to mix the activated sludge and waste water, producing a mixed liquor. Heterotrophic bacteria suspended in the activated sludge convert nitrates into nitrogenous gases under anoxic conditions. Mixed liquor from this stage passes to the second stage which is aerated to maintain a dissolved oxygen concentration between 0.2 and approximately 6 mg/liter. Nitrifying activated sludge bacteria biologically nitrigy nitrogenous compounds, producing nitrates. Mixed liquor containing nitrates formed in this stage is recycled to the first stage at a daily average of at least 0.8 times the first stage feed rate, by volume, of waste water. The mixed liquor residence time in the first stage is sufficient to denitrify 80% by weight or more of the recycled nitrates. Mixed liquor is passed from the nitrification stage to another stage where turbulence is induced, and mixed liquor residence time is sufficient for endogenous bacterial respiration to reduce oxygen and then convert 60% by weight or more of the nitrates to nitrogen gas. Mixed liquor is then passed to a solids separation stage to produce an activated sludge with a concentrated bacteria suspension and a clarified effluent. Clarified effluent is withdrawn from the separation stage. (Snyder-FIRL)
W76-12603

APPARATUS FOR BIOLOGICAL PURIFICATION OF AN EFFLUENT,
J. R. Kaelin.
United States Patent 3,965,009. Issued June 22, 1976. Official Gazette of the United States Patent Office, Vol. 947, No. 4, p 1726, June, 1976. 1 fig.

Descriptors: *Patents, *Waste water treatment, *Biological treatment, *Activated sludge, *Treatment facilities, Effluents, Equipment, Basins.

An apparatus was patented for biologically purifying an effluent. It includes two identical basins which are sealed gas-tight at their top portion and have a common wall. This common wall has through passages interconnecting the basins. The effluent being purified is fed alternately to each basin. The purified water is then discharged alternately from each basin. When the concentration of activated sludge in one basin falls below a specified level, the operation changes direction; the other basin serves as the activated sludge basin and the first basin serves as a final purification basin. An aeration impeller is provided for enriching the effluent with oxygen or a mixture containing oxygen and for agitating the effluent in the basin functioning as the activated sludge basin. The impeller is double-sided and has a supply line for oxygen that extends into one of its intake openings. A slide that is vertically movable is provided in the upper part of the common wall to open and close a passage in its upper end. Rails and rollers are provided to reciprocally support the aeration impeller on the basins and to slidably move the aeration impeller through the movable passage between the basins. Excess oxygen is removed from the upper part of the basins. (Snyder-FIRL)

LIVING FILTER PERKS UP REGIONAL SYSTEM,
Keifer Associates, Inc., Chicago, Ill. Western Michigan Office.
R. L. Lappo.
Water and Wastes Engineering, Vol. 13, No. 6, p 18-22, 33, 44, June, 1976. 2 fig, 3 tab.

Descriptors: *Irrigation, *Waste water treatment, *Water reuse, *Symbiosis, Domestic wastes, Industrial wastes, Oxidation lagoons, Biological treatment, Aeration, Chlorination, Treatment facilities, Michigan, Regional development, Soil filters, *Filtration.
Identifiers: *Muskegon County(Mich), *Soil filtration.

An irrigation system for treating waste water from 13 cities and towns and five major industries in Muskegon County, Michigan is described. Raw waste water is pumped 11 miles through a 66-inch reinforced concrete force main to a waste water treatment facility. The raw sewage is intensively oxygenated for three days by mechanical aeration and then stored in lagoons that function as oxidation and settling ponds. Effluent ready for irrigation is discharged through an outlet lagoon which has a surface area of 14 acres and a working depth of 12 feet. Immediately prior to irrigation, the water passes through a chlorinator for disinfection. Tertiary treatment is obtained by passing the effluent from the lagoon treatment facilities through the aerobic soil zone. The irrigation facilities are designed to apply the annual supply of waste water during a 7-month irrigation season. The daily average influent to the system is 28.5 million gallons/day, with 40% of it being domestic and 60% industrial. (Kreager-FIRL)

Descriptors: *Mass transfer Rates, *Trickling f ters, *Oxygen, Performance, *Waste water trea ment, Biochemical oxygen demand, *Desi criteria, Odor, Kinetics, *Filters, Filtration
Identifiers: Oxygen transfer rate

The limiting effect of the oxygen transfer rate trickling filter performance is discussed. There a pears to be no real understanding as to what exte oxygen transfer must be limited before proble occur, and it is not possible to obtain more tha rough estimate of the maximum influent orga concentration using available data. In many are of the country, there are periods, especially duri the summer, when essentially no air flow occu through trickling filters because temperature d ferentials are negligible; however, detailed repo on the results of no air flow are not documented the literature. The maximum applied biochemi oxygen demand concentration determined trickling filters packed with plastic media is e mated at 400 mg/liter and seems to be appropri for design purposes, although it is probably a c servative figure. When biochemical oxygen mand concentrations in excess of 500-600 mg/li are applied, the mass transfer rate of oxygen m become limiting. The probability of odor prod tion will also increase under these conditio (Kreager-FIRL)

COLESHILL (1): EXPERIMENTING WI WASTE WATER TREATMENT,
N. Banks.
Water, No. 8, p 20-22, May, 1976.

Descriptors: *Pilot plants, *Treatment facilit *Tertiary treatment, *Waste water treatme Equipment, Biological treatment, Flocculati Activated carbon, Filtration, Aeration, Sett basins, Monitoring, Instrumentation, Progra Design, *Design criteria.
Identifiers: Physico-chemical treatment, Un Kingdom.

The design of an advanced waste water treatm pilot plant in the United Kingdom which was c structed as a result of a study on advanced wa water treatment methods by the Committee on Challenges of Modern Society is described. design involves parallel feed streams of wa water piped along both faces of a fixed gantry mobile treatment units which may be connecte any order to either feed stream. Units dealing physico-chemical treatment include: chem flashmixing and flocculation tanks and multim and activated carbon filters. There are acid/alkaline adjustment facilities and a fixed stallation for preparing and dosing chemials. bile units for conventional biological treatm processes include surface aeration tanks and h rate biological filters. Five pairs of mobile set tanks and a fixed installation for sludge treatm are common to both the physico-chemical biological treatment processes. Plant performa is monitored by portable sensors which tran data to a central data-logging installation. (See W76-12610) (Kreager-FIRL)

AMMONIA REMOVAL FROM WASTEWA BY LIGAND EXCHANGE,
National Environmental Research Center, Ci nati, Ohio.
R. A. Dobbs, S. Uchida, L. M. Smith, and J. M Cohen.
Adsorption and Ion Exchange, Vol. 152, No. 157-163, 1975. 7 fig, 4 tab, 11 ref.

UNIVERSITY OF ILLINOIS-URBANA-CHAMPAIGN

Descriptors: *Ion exchange, *Ammonia, *Waste water treatment, *Municipal wastes, Feasibility studies, Evaluation, Performance, Chemical reactions, Phosphates, Sulfates, Alkalinity.
Identifiers: *Ligand exchange.

The technical feasibility of removing ammonia from municipal waste water by a ligand exchange process was demonstrated along with the subsequent regeneration of the exhausted exchanger with low pressure steam. An ion exchanger containing hydrous zirconium oxide was converted to the cupric form for removing ammonia by the mechanism of ligand exchange. Copper bleed during loading was less than one microgram/liter of copper. The pH of the waste water being treated was found to be important since undissociated ammonia rather than ammonium ion was the species involved in the reaction; the optimum pH range was between 10 and 11. The common waste water anions, phosphate and sulfate, did not compete with ammonia at concentrations of 10 and 100 milligrams/liter, respectively; and no exchange in ammonia capacity was observed in the presence of these ions. The exhausted exchanger was readily regenerated by steam at a temperature of 135 C. Additional research is needed to establish the process as an alternative for ammonia removal. (Kreager-FIRL)

SEWAGE PLANT UPGRADES EFFLUENT.
Water and Sewage Works, Vol. 123, No. 6, p 72-73, June, 1976.

Descriptors: *Recycling, *Sewage treatment, *Treatment facilities, *Costs, *Water reuse, Filtration, *Effluents, Solid wastes, Equipment, Efficiencies.

The recycling of secondary treatment effluent has significantly improved the efficiency of internal operations at the Metropolitan Denver Sewage Disposal District Number 1 plant near Commerce City, Colorado. A portion of the effluent from the secondary clarifiers is used for several utility functions normally requiring clean tap water. An Adams VWS-16 Automatic Water Strainer is used to remove solids from the secondary treatment effluent prior to recycling. The strainer is equipped with Poroedge tubes with a slot width of 0.010 in and is designed for automatically programmed backwash based on the total pressure drop across the system. During the backwash cycle, the tubes are backwashed sequentially, one tube at a time, and the backwash water is returned to the system input. The recycled water is available at virtually no cost and affords a significant savings over municipal tap water used for the same purpose. (Kreager-FIRL)
W76-12613

SUBMERSIBLE PUMPS UPGRADE SEWAGE HANDLING.
Water and Sewage Works, Vol. 123, No. 6, p 70-, June, 1976.

Descriptors: *Pumping plants, *Sewage disposal, Subsurface flow, *Municipal wastes, *Pumps, Equipment, *Waste water treatment, Treatment facilities, Efficiencies, Maintenance, Mechanical equipment, Sanitary engineering, Waste water disposal.
Identifiers: *Submersible pumps.

The use of submersible pumps in the city of Belleville, Illinois to upgrade sewage handling is discussed. In addition to more efficient waste water handling, submersible pumps also offer the following advantages: only a single wet well is required; only one discharge valve is required for each pump, and no influent valve is required; accessory equipment such as fans, dehumidifiers, ladders, and lights is unnecessary; and maintenance and repair requirements are reduced. The submersible stations being installed in Belleville are all of the duplex type, each equipped with a pair of Flygt electric submersible pumps. Thus far, the installation of submersible pumps has saved about 3 hours each day in maintenance and inspection time. Another advantage of submersible stations is the relative ease of increasing station capacity as dictated by the growth of an area. At one pumping station, for example, the capacity was tripled by simply changing pumps and two components in the control panel; no changes in piping or other modifications were required. (Kreager-FIRL)

ELIMINATION OF TRACE-ELEMENTS BY SLOW-SAND-FILTRATION (ELIMINIERUNG VON SPURENMETALLEN DURCH LANGSAM-SANDFILTER),
U. Schoettler.
Zeitschrift fuer Wasser- und Abwasserforschung, Vol. 9, No. 3, p 88-93, 1976. 17 fig, 1 tab.

Descriptors: *Waste water treatment, *Biological treatment, *Treatment facilities, *Trace elements, *Filtration, Sands, Zinc, Cadmium, Copper, Lead, Chromium, Metals.
Identifiers: *Sand filters, Slow sand filtration, Arsenic.

The behavior and cleansing capacities of a biologically based filtration system for zinc, cadmium, copper, lead, arsenic, and chromium were estimated by long-term tests with simulated slow-sand-filtration. EDTA's remobilizing ability was subsequently tested, underscoring complexing agents which are important in water treatment. Algae and the sand used for filtration were analyzed to determine changes during testing. The filters sufficiently eliminated all trace-elements except cadmium and arsenic. (Snyder-FIRL)

WASTE WATER TREATMENT -- A NEW CONCEPT (EPURATION D'EAUX RESIDUAIRES -- NOUVELLE CONCEPTION).
Informations Chimie, No. 152, p 165-166, February, 1976. 1 tab.

Descriptors: *Waste water treatment, *Biological treatment, *Adsorption, *Percolation, *Suspended solids, Chemical oxygen demand, Biochemical oxygen demand, Activated carbon.
Identifiers: *Tecflow.

When activated carbon is located downstream from a biological waste water treatment installation, adsorption is frequently blocked by bacteria colonies. By placing the activated carbon upstream, the water's pH is kept fairly low, thereby minimizing bacterial growth. To optimize these conditions, a material was developed, Tecflow, which, in a first zone, acts as a fluidized bed adsorbent, and, in a second zone, as a fixed bed adsorber floating on the fluidized bed. This system allows for the percolation of waters containing up to 100 mg of suspended matter, thereby avoiding primary decantation which generally produces diluted and hard to dispose of sludge. A blockage of about 20% COD will lower toxicity concentrations by 50-70% after passage on Tecflow. Trials in a waste water plant producing 1,000 cu m/d of various solvent and industrial wastes effected a 99% BOD and 98% COD decrease. (Waltner-FIRL)

PERFORMANCE COMPARISON SURVEY OF THE PUBLIC SEWAGE-TREATMENT PLANTS IN BADEN-WUERTTEMBERG 1975 (LEISTUNGSVERGLEICH FUER KLAERANLAGEN 1975 IN BADEN-WUERTTEMBERG),
C-H. Burchard.
Forum Umwelt Hygiene, Vol. 27, No. 5, p 175-177, 1976. 3 tab, 3 ref.

Descriptors: *Waste water treatment, *Sewage treatment, *Sewerage, *Treatment facilities, Europe, Public utilities, Training, Water purification, *Performance.
Identifiers: *Baden-Wurttemberg(Germany).

Since 1972 Baden-Wurttemberg has had codes controlling public sewage treatment plants. Advanced training for operators of sewage works provides the necessary knowledge for bringing about this control. A 'Performance Comparison Survey' of the public sewage treatment plants in Baden-Wurttemberg was conducted for the second consecutive year in 1975. The purification procedure requirements were satisfied by 52% of the public sewage treatment plants operating in Baden-Wurttemberg. Outstanding purification performances were demonstrated by one out of seven plants. (Snyder-FIRL)

REMOVAL OF PHOSPHORUS AND NITROGEN FROM WASTEWATER BY SPRAY IRRIGATION OF LAND,
Michigan State Univ., East Lansing.
D. B. Shah.
Available from University Microfilms, Ltd., Ann Arbor, Mich., 48106, Order No. 76-12519. Ph.D. Thesis, 1975, 287 p.

Descriptors: *Waste water treatment, *Phosphorus, *Nitrogen, *Irrigation, *Waste water(Pollution), Adsorption, Nitrification, Denitrification, Mathematical models, Soil water movement, Soils.

Spray irrigation of land is being considered for the removal of phosphorus and nitrogen from waste water. Various reactions such as phosphorus adsorption, nitrification, and denitrification were studied, and mathematical models were developed to predict their movements in soil. The phosphorus model was derived using material balances on water and on phosphorus in the liquid and solid phase. It was assumed that non-equilibrium conditions prevail between phosphorus concentration in the liquid phase and on the soil. The water transport equation was dropped when it was determined that the water front moved much faster than the phosphorus front. Results of the simulation compared remarkably well with data from a spray irrigation site, and the soil system was efficient in phosphorus removal. Kinetic constants for the nitrification and denitrification reactions were evaluated. It was determined that nitrification can be considered a first order reaction in the range of nitrate concentrations encountered in waste water and that three times as much organic carbon is required as nitrate nitrogen for complete nitrogen removal. Material balance equations were written for ammonium nitrogen and nitrate nitrogen in the liquid phase and all the gas phase components. The simulation results compared very well with the experimental results; complete nitrogen removal was not accomplished even at very low flow rates. The nitrogen removal ability of the soil was found to be more important than its phosphorus removal capability in selecting a land disposal site. (Snyder-FIRL)

KINETICS AND PROCESS CONTROL OF NITRIFICATION IN COMPLETELY MIXED BIOLOGICAL WASTEWATER TREATMENT,
Texas A and M Univ., College Station.
A. C. Petrasek, Jr.
Available from University Microfilm, Inc., Ann Arbor, Mich., 48106, Order No. 76-12687. Ph.D. Thesis, 1975, 232 p.

Descriptors: *Waste water treatment, *Activated sludge, *Chemical oxygen demand, *Biological treatment, *Control, Nitrification, Oxidation, Hydrolysis, Testing, Ammonia, Organic compounds.
Identifiers: *Sludge age, *Kinetics, Ammonia nitrogen, Organic nitrogen.

A study was undertaken to determine the nitrification kinetics in completely mixed activated sludge processes and define the nitrification process control requirements for these systems. The kinetics of ammonia nitrogen oxidation and organic nitrogen hydrolysis were evaluated with 25 batch tests under varying conditions. Organic nitrogen hydrolysis to ammonia nitrogen follows first-order kinetics; ammonia nitrogen oxidation has zero-order kinetics. The reaction rate for organic nitrogen hydrolysis was significantly faster than that for ammonia nitrogen oxidation. More importantly, the rate depended on sludge age. To further determine the complex relationships existing in biological waste water treatment processes, five years of data from the Demonstration Plant of the Dallas Water Reclamation Research Center were evaluated. Sludge age was the best indicator for microorganism growth rate. Excellent correlations were developed between sludge and ratio of food to microbes, gross yield coefficient and sludge age, sludge age and dissolved oxygen uptake rate, and sludge age and Kjeldahl nitrogen removal. The significant improvement in chemical oxygen demand (COD) removal for activated sludge system operation in which nitrification takes place was also quantified. Alkalinity's importance was identified in process control for nitrifying activated sludge systems. A decrease in alkalinity of 6.0 mg/liter is indicated for each 1.0 mg/liter of total Kjeldahl nitrogen that is removed or oxidized. The data also indicate that sludge age should be increased by 0.56 days for every Fahrenheit degree decrease in the temperature of the aeration basin. (Snyder-FIRL)

WASTEWATER RECLAMATION AND RE-USE: THE RESPONSIBILITIES OF THE CONSULTING ENGINEER,
California Univ., Los Angeles.
C. H. Tate.
Available from University Microfilms, Inc., Ann Arbor, Mich. 48106, Order No. 75-26996. Ph. D. Thesis, 1975, 265 p.

Descriptors: *Waste water treatment, *Planning, *Design, *Water reuse, *Sanitary engineering, Public health, Costs, Treatment facilities.

The consulting engineer must provide sound input to all phases of waste water reclamation and reuse systems including initial planning, selection of a reclamation process and design of a reuse system. Prior to starting a waste water reclamation and reuse project, careful consideration should be given to preliminary factors including public health implications of reuse, applicable regulatory agency policies, and costs. The responsibilities of the consulting engineer in the various stages of waste water reclamation and reuse are illustrated by case studies. The planning process is described using the Comprehensive Water Quality Plan for the San Diego Basin. Testing, evaluation and selection of a recommended reclamation process are discussed with respect to the Prototype Plant Study for the Chino Basin Municipal Water District. The Expansion of the Wastewater Treatment Plant at Walt Disney World, Florida, is discussed as an example of reuse systems. (Orr-FIRL)

THERMOPHILIC AEROBIC MICROBIOLOGICAL TREATMENT OF HIGH STRENGTH WASTEWATERS AND RECOVERY OF PROTEIN,
Illinois Univ. at Urbana - Champaign.
G. A. Sueruecue.
Available from University Microfilms, Inc., Ann Arbor, Mich. 48106. Order No. 75-24413. Ph. D. Thesis, 1975, 164 p.

Descriptors: *Biological treatment, *Aerobic treatment, *Waste water treatment, Microorganisms, Bacteria, Chemical oxygen demand, Nutrient requirements, *Thermophilic bacteria.
Identifiers: Mesophilic bacteria, Solids retention time.

The thermophilic aerobic treatment of high strength waste waters was studied in both batch and continuous flow systems. The growth requirement of thermophilic organisms in mixed culture, the kinetic behavior of the culture, the effects of solids retention time on the system, and the protein content of the harvested biomass were considered. The rate of growth was highest at 58C. The minimal nutritional requirements for the organisms included methionine, magnesium, calcium, and iron as well as carbon, nitrogen, and phosphorus. The maximum removal of soluble organic matter was obtained when the system was operated with a solids retention time (SRT) of 5 days or more. A one day SRT achieved 85% COD removal, a 2 day SRT achieved 90% removal, and after 5 days the COD removal was 95%. The specific oxygen utilization rate depended upon the solid concentration and the specific substrate utilization rate which were themselves dependent upon the SRT. No nitrification occurred in any of the SRT systems studied. The thermophilic process is capable of treating high strength waste water more effectively and rapidly and of producing less sludge than a mesophilic system. The biomass produced contained about 45% protein. (Orr-FIRL)

ION EXCHANGE REMOVAL OF INORGANIC AND ORGANIC WASTEWATER CONSTITUENTS,
Colorado Univ., Boulder.
T. Panswad.
Available from University Microfilms, Inc., Ann Arbor, Mich. 48106. Order No. 75-23632. Ph. D. Thesis, 1975, 242 p.

Descriptors: *Waste water treatment, *Ion exchange, *Municipal wastes, *Water reuse, Activated carbon, Chemical oxygen demand, Resins, Anions, Operating costs, Organic compounds, Inorganic compounds.

A study was conducted jointly by the Denver Water Board and the University of Colorado on the use of ion exchange for demineralizing the Denver Metro waste water. Two anionic resins, Duolite S-37 and A-30B, were studied for their structure and capabilities in simultaneous removal of organic and inorganic materials. The resins were tested in conjunction with a weak acid-strong acid cationic exchanger couple. Using weak base resins prior to and after the cationic couple achieved about a 20% removal of COD. The system consisting of a cationic couple and a degasifier followed by an anionic resin bed was optimized. This system was capable of removing all sulfate ions, about 83% of the chloride ions and 95% of the orthophosphate over a 200 bed volume throughput. When the system employed S-37 resin, average COD removal was 64.6%. COD removal averaged 50.1% when A-30B resin was used. Treatment costs were 29.4 and 27.1 cents/1000 gallons of water treated with S-37 and A-30B, respectively. The addition of activated carbon columns to the end of systems increased the overall average COD removal to 82.6 and 79.2% from the systems containing the S-37 and A-30B resins. The increase in treatment cost was 7.1 and 8.4 cents/1000 gallons, respectively. (Orr-FIRL)

NITRATE REDUCTION IN PEAT,
Minnesota Univ., Minneapolis.
B. A. Jaouich.
Ph. D. Thesis, 1975, 149 p.

Descriptors: *Waste water treatment, *Peat, Nitrogen compounds, *Denitrification, Biological treatment, Microorganisms, *Nitrates, Pseudomonas.

The reduction and removal of nitrogen compounds by biological denitrification in peat using three types of peat, Fibric, Hemic, and Sapric, were studied. Waste water from a local treatment plant was added to 60 cm deep columns of peat at different rates of application. Solutions of nitrate nitrogen from 10 mg/liter to 1000 mg/liter were added to the waste water to test the capacity and duration of the peat renovation system. With residence times between 1.75 and 7 days, Fibric peat was the most promising material for nitrogen removal, followed by Sapric and Hemic. The evolution of nitrous oxide and carbon dioxide was used as an index of biological denitrification. The concentrations of these gases increased as the amounts of nitrate nitrogen added increased. At the end of the experiment, the concentrations of total nitrogen had decreased in the upper layers of Fibric and Sapric but were generally higher in Hemic. The concentrations of total carbon had decreased most in Hemic followed by Sapric and Fibric. Representative strains of denitrifying Pseudomonas spp., isolated from the peats, were most abundant in Fibric followed by Hemic and Sapric. It was shown that the isolated Pseudomondaceae reduced the added nitrates to elemental nitrogen. The peat water renovation system is an effective and inexpensive method for solving waste water problems where suitable land is available. Performance is excellent and operation is relatively simple. SECOND ATTEMPT TO TREAT ANGLIA'S TOXIC WASTES,
P. Millbank.
Surveyor, Vol. 147, No. 4380, p 17, May 21, 1976. 1 tab.

Descriptors: *Waste water treatment, *Biological treatment, *Treatment facilities, *Industrial wastes, *Liquid wastes, Reclamation, Foreign countries, Attitudes.
Identifiers: *Physical treatment, *Chemical treatment, *Toxic wastes, United Kingdom.

Hales Industrial Services have re-applied to build an industrial liquid waste reclamation and treatment plant near Bury St. Edmunds, Suffolk. A previous application 3 yr ago provoked much local controversy, and the county planning committee finally rejected it. The new application omits incineration, which had attracted the most local criticism. The new plant is considered to be very much in the country's interests. It also has implications for surrounding counties. The plant will reduce the long distance haulage of waste material. The objectives of the plant are to recover scarce materials, render wastes harmless, and offer reprocessing. Physical treatment will involve separation and filtration; chemical treatment will use reagents; and biological treatment will employ a high-rate filter. Up to 17,000 gallons of de-contaminated water and 30 tons of filter cake will be generated daily. The climate of informed opinion has shifted significantly in the direction of more regionalized treatment and disposal of notifiable wastes compared to when the original application was made. DESIGN OF INTEGRATED APPROACH TO NUTRIENT REMOVAL,
Brown and Caldwell, Walnut Creek, Calif.
D. L. Eisenhauer, R. B. Sieger, and D. S. Parker.
Journal of the Environmental Engineering Divisions, Proceedings of ASCE, Vol. 102, No. EE1, p 37-54, February, 1976. 6 fig, 11 ref, 1 append.

Descriptors: *Waste water treatment, *Biological treatment, *Treatment facilities, *Water reuse, *Integrated control measures, Nutrients, Design, Reclamation, Reclaimed water, Industrial water, *Nutrient removal, *Design criteria, California.

The Central Contra Costa Sanitary District's Water Reclamation Plant currently being built near Concord, California, will produce water for industries located along the shores of Suisun Bay. Four miles of pressure pipeline will link the industries to the plant. Seventy-five percent of the reclamined water will be used for cooling and the remainder for process purposes. Reclaimed water in excess of industrial needs will be discharged to the bay. It will not harm the receiving waters because it will be virtually free of oxygen demanding materials, nutrients, and toxicants. The plant was designed following 2 yr of testing at the Advanced Treatment Test Facility (ATTF) at the site of the CCCSD's existing treatment plant. The new plant's treatment system combines lime clarification in the primary sedimentation tanks, biological nitrification-denitrification, a multimedia rapid sand filtration system for effluent polishing, a two-state sludge conditioning process, and a wet and dry lime classification process with recalcining

and lime recovery. The plant is designed for expansion and will be constructed in increments as the need arises. Nitrogen will be removed to prevent algal growth in receiving waters and industrial water systems. Phosphorus will be removed to control calcium-phosphate scaling. A dual computer system will monitor and control the entire plant process. (Snyder-FIRL)

Identifiers: *Cell residence time.

The relationship between the operational characteristics of an activated sludge system and the concentration of nonadsorbable organic compounds present in the secondary effluent was studied. Activated sludge units were operated at cell residence times (CRT) of 0.8 days, 4.8 days, 12.3 days, and 19.4 days. Batch adsorption tests were conducted using secondary effluent from these systems. The equilibrium chemical oxygen demand (COD) for each was determined as a function of carbon dosage. Membrane separation techniques were used to fractionate the organic matter by size, in order to study the adsorption by activated carbon of the size fractions. Continuous flow column studies were also conducted. The CRT of an activated sludge system significantly affects the concentration of nonadsorbable organic matter in the effluent from the system. There was little change in the concentration of adsorbable material, however, particularly as the CRT was increased from 4.8 days to 19.3 days. The concentration of nonadsorbable material was not significantly affected by pH changes. Some nonadsorbable organic matter was present in each size fraction. Relatively simple laboratory batch tests can be used to determine the amount of nonadsorbable material in a waste water and thus to predict the best possible effluent achievable with a carbon column in the absence of biological activity. CRT should be considered as a new variable in addition to those currently used in designing treatment systems. The manner in which the secondary biological system is operated should be considered in any subsequent treatment of the effluent by activated carbon. (Snyder-FIRL)

PERFORMANCE OF SINGLE HOUSEHOLD TREATMENT UNITS,
Wisconsin Univ., Madison. Dept. of Civil and Environmental Engineering.
R. J. Otis, and W. C. Boyle.
Journal of the Environmental Engineering Division Proceedings of ASCE, Vol. 102, No. EE1, p 175-189, February, 1976. 6 fig, 5 tab, 8 ref, append.

Descriptors: *Waste water treatment, *Pollutant identification, *Biochemical oxygen demand, *Chemical oxygen demand, *Treatment facilities, *Domestic wastes, *Performance, Anaerobic conditions, Aerobic treatment, On-site tests, Septic tanks.

Eight installations at private homes in Wisconsin were used to test anaerobic and aerobic household waste treatment processes. These included six systems with single compartmented septic tanks, one with two septic tanks in series, two with continuous flow-through extended aeration units, and one with a batch aeration unit. Samples from each step in the treatment process were analyzed for biochemical oxygen demand (BOD), chemical oxygen demand (COD), solids, total nitrogen, phosphorus, total and fecal coliform, and fecal streptococcus. Effluents from aerobic units had mean concentrations of mg/liter BOD and 53 mg/liter total suspended solids (TSS) as compared to 158 mg/liter BOD and 54 mg/liter TSS in septic tank effluent. Most of the aerobic processes, however, would not meet current national secondary effluent BOD and TSS criteria without modification or additional processing. Septic tanks were more stable in seven of the 11 parameters tested. Nearly complete nitrification and some denitrification occurred in the aerobic units; ammonia and organic nitrogen dominated in septic tank effluent. The following appear beneficial in maintaining high effluent quality from aerobic units: a septic tank or trash trap preceding the aeration chamber to remove grease, floating solids, and large debris; flow equalization; returning floating solids at least twice daily; maintaining mixed liquor temperatures above 15C; effluent weirs at least 24 in. long with scum and deflection baffles; and regular maintenance with inspections at least ever 2 mo. ALBUQUERQUE PLANT DESIGNED WITH COMPUTER IN MIND,
William Matotan and Associates, Albuerque, New Mex.
J. L. Ricoy, and W. I. Matotan.
Water and Wastes Engineering, Vol. 13, No. 1, p 32-35, 37, January, 1976.

Descriptors: *Treatment facilities, *Waste water treatment, New Mexico, Activated sludge, Trickling filters, *Aeration, Computers, Equipment, Settlement basins, Anaerobic digestion, *Sewage treatment, Waste disposal.
Identifiers: Process control, Albuquerque(NM), Screw pumps.

A new secondary treatment plant in Albuquerque is described. The new activated sludge waste water treatment plant includes a process control computer system, new laboratory testing equipment, and monitor sensors. The two existing plants incorporates trickling fpuilters. In the new scheme, effluents from the two old plants combine and pass through a series of screw pumps to the aeration tanks, the final settling tanks, and then to the Rio Grande river for disposal. Aeration facilities were designed so that the plant can operate as either conventional taped aeration, step aeration, or contact stabilization. Diffused air is used for mixing and oxygen needs. Final settling tanks are of rapid sludge removal type. Anaerobic digestion handles sludge solids, and the resulting gas is used to generate electricity through the system. Pumps and blowers are controlled by the computer on the basis of a running time inventory. This is also used an aid in determining maintenance and overhaul schedules. Dissolved oxygen levels in the aeration tanks are continuously monitored by the computer. Algorithms are provided in the system for a wide variety of controls and samplings. The computer has a fixed head mass memory of 246K and a core memory of 24K, both expandable. (Pinto-FIRL)

WASTEWATER TREATMENT FACILITY, PARIS UTILITY DISTRICT,
Consulting Engineer, Vol. 46, No. 6, p 67, June, 1976. 1 fig.

Descriptors: *Waste water treatment, *Treatment facilities, *Utilities, *Food processing industry, *Cities, Domestic wastes, Tannery wastes, Industrial wastes.

Two industries and a town worked together for over a decade developing a sophisticated waste water treatment facility. The industrial-municipal plant, designed for combined domestic, tannery, and food processing wastes, eliminated the necessity for separate facilities. The two industries which had previously discharged inadequately treated waste to the Little Androscoggin River now satisfy state and Federal waste discharge requirements. The city now has the services necessary for future industrial and residential development without river pollution. The facility treats about 1.35 mgd combined industrial and domestic wastes. The process controls and blends the waste streams for optimal performance, and incorporates several unusual operations. Automatic pumping systems for pH control optimize clarification removal and prevent release of odorous gases by sulfides in the waste. Chromium is removed by chemical precipitation brought about by equalizing two waste streams with pH control without added chemicals. Tannery stack gas serves as a carbon dioxide source reacting with free lime in industrial waste, forming calcium carbonate. Refractory chemical removal is optimized by unconventional upflow clarifiers. Maintenance and operation costs are reduced by separate sludge centrifugation. Other features that reduce cost and improve efficiency include a multiuse pumping system, automatic recording process control and alarm systems, and a space and cost saving 800-kw turbine engine. SEPTIC TANK EFFICIENCY,
ADI Ltd., Fredericton (New Brunswick).
T. Viraraghavan.
Journal of the Environmental Engineering Division Proceedings of ASCE, Vol. 102, No. EE2, p 505-508, April, 1976. 3 tab, 2 ref, 1 append.

Descriptors: *Waste water treatment, *Pollutant identification, *Sewage treatment, *Sewerage, *Treatment facilities, Biochemical oxygen demand, Chemical oxygen demand, *Septic tanks, Efficiencies.

A study on the actual performance of a rural household septic tank was carried out for the year 1973. Samples of raw sewage and septic tank effluent were analyzed for pH, total suspended solids (TSS), biochemical oxygen demand (BOD), chemical oxygen demand (COD), soluble organic carbon (SOC), total phosphates (P04-P), ammonia nitrogen, nitrate nitrogen, total soluble iron, chlorides, total coliforms, fecal coliforms, fecal streptococci, Standard Plate Count (SPC), and Pseudomonas aeruginosa. About 20% of the TSS and 50% of COD and BOD were removed by the septic tank. There was very little indicator organism removal. However, over 80% of Pseudomonas aeruginosa was removed by the septic tank. Low removals of TSS and bacteria may result from re-entrainment of sedimented material into the effluent stream. A NEW APPROACH TO THE DESIGN OF FILTRATION SYSTEMS,
Loughborough Univ. of Technology (England). Dept. of Chemical Engineering.
D. C. Freshwater.
Filtration and Separation, Vol. 13, No. 3, p 242-248, May-June, 1976. 9 fig, 2 tab, 8 ref, 1 append.

Descriptors: *Waste water treatment, *Analytical techniques, *Treatment facilities, *Design, *Filtration, Suspended solids, Liquids, Optimization.

It is important, in designing solid-liquid separation processes, to consider the system as a whole and not simply the individual design and specifica-

UNIVERSITY OF ILLINOIS AT URBANA-CHAMPAIGN

of the separate plant items. First the problem must be defined, including the nature of the feed, the changes that may occur during filtration, and the desired product quality. Then several alternative processing systems are chosen for consideration in detail. The alternatives are then assessed, beginning with calculating the material balance over the system. After the most appropriate system is chosen, it is optimized to produce the given throughput at a minimum cost. Allowance must be made for uncertainty, including variations in feed, environmental conditions, and throughput. Reliability theory may be used to assess the success probability of a given design. TURN SEWAGE INTO FUEL.
Canadian Chemical Processing, Vol. 60, No. 6, p 4, 6, June, 1976. 2 fig.

Descriptors: *Waste water treatment, *Sewage treatment, *Sewerage, *Biochemical oxygen demand, *Treatment facilities, *Fuels, Coals, Filters, Ions, Cadmium, Iron, Chromium, Manganese, Zinc, Copper.

A sewage treatment process under development produces a combined coal and sludge by-product that could be used as fuel. A filter bed of finely crushed coal is used to give a final biological oxygen demand of under 2 ppm and a 90% reduction in heavy metal ions. Effluent is charged from the upper part of the settling tank; suspended solids and additional pollutants settle to the bottom where they combine with coal particles for removal from the system. The supernatant liquid flows into a sump tank surrounding the settling tank. The filter bed absorbs cadmium, iron, chromium, manganese, zinc, and copper ions, along with wastes that induce biochemical oxygen demand (BOD) at between 0.5 and 0.6 gm/gm of coal. The treated water flows from the outer edge of the filter bed into another cylindrical tank where it is charged onto a sprinkling filter bed of coal to be treated further. A rake arm on the inclined lower part of the structure rakes out loaded coal particles in small portions from the lowest part of the filter bed. This sludge is then raked to the tank's center-well, where a bucket conveyor raises it to the upper part of the structure for disposal along with suspended solids and other wastes from the settling tank. One kg of coal sludge is generated for each cu m of waste water treated. It contains up to 60% water and can provide a minimum of 2,000 cal/gm when burned. The sludge could supply up to 15% of the required fuel for a power plant. Its heavy metal content would present no problem; it would be collected in the ash residue. (Snyder-FIRL)

EFFLUENT IRRIGATION OF RYE AND RYEGRASS,
Florida Univ., Gainesville. Dept. of Agricultural Engineering.
A. R. Overman, and H-C. Ku.
Journal of the Environmental Engineering Division, Proceedings of ASCE, Vol. 102, No. EE2, p 475-483, April, 1976. 4 fig, 6 tab, 12 ref, 2 append.

Descriptors: *Effluents, *Irrigation, *Soil types, Florida, *Forages, Weight, Harvesting, Rates of application, Soil moisture, Nutrients, Potassium, Absorption, Crop production, *Grasses, Water reuse, Recycling.
Identifiers: *Rye, *Ryegrass.

Rye and ryegrass grown on sandy soil in Florida were irrigated with secondary effluent. Forage was weighed after harvesting and samples were analyzed. Both responded well to irrigation with secondary municipal effluent. Dry matter yields showed a positive response to increased irrigation rates. Dry matter content decreased with irrigation, since soil moisture was more available to plants. Nutrient uptake generally increased and recovery efficiency declined with application rate. The effluent was deficient in potassium relative to other elements for production of rye or ryegrass. Potassium uptake exceeded applied potassium for most irrigation rates for both crops. Supplemental potassium might improve crop production with effluent irrigation. (Snyder-FIRL)

THE USE OF FLUID CATALYTIC CRACKING CATALYST IN ACTIVATED SLUDGE WASTE-WATER TREATMENT,
Exxon Research and Engineering Co., Linden, N.J. Corporate Research Labs.
R. D. Schwartz, and C. J. McCoy.
Journal Water Pollution Control Federation, Vol. 48, No. 2, p 274-280, February, 1976. 2 fig, 5 tab, 5 ref.

Descriptors: *Waste water treatment, *Sewage treatment, *Activated sludge, *Sewerage, *Catalysts, Activated carbon, Waste water(Pollution), Industrial wastes, Municipal wastes.
Identifiers: Refinery wastes.

Regenerated spent fluid catalytic cracking catalyst was assessed as an enhancer of conventional activated sludge water treatment systems and compared with activated carbon. Activated sludge and waste water were obtained from a refinery and a municipal sewage treatment plant. The sludge was allowed to settle for one hour, after which the supernatant was removed and replaced with waste water. The sludge-waste water mixture and either cracking catalyst or activated carbon were incubated at 30 C and shaken, after which the sludge settling rate and percentage settling by volume, and the percentage transmittance at 660 nm and total organic carbon (TOC) of the supernatant were measured. The catalyst increased the sludge settling rate, decreased the settled sludge volume and supernatant TOC, and increased supernatant clarity of a refinery activated sludge system as compared with conventional activated sludge treatment alone. It markedly reduced phosphate levels in a municipal sewerage activated sludge system. The catalyst may be acting like other aluminas and alumina-silicates, which absorb microorganisms and organic compounds. Results with refinery activated sludge were more promising than those with municipal sewerage activated sludge. Because of a dilute sludge and low initial TOC levels in the waste water, however, the municipal sewerage activated sludge may not have been a suitable test system. The observed effects may result from the support adsorbing contaminants directly, providing a surface on which the microbial population can adsorb, and promoting sludge settling and compaction by acting as a nucleation center for the bio-floc,

NITRIFYING ORGANISM CONCENTRATION AND ACTIVITY,
Union Carbide Corp., Tonawanda, N.Y.
E. G. Srinath, R. C. Loehr, and T. B. S. Prakasam.
Journal of the Environmental Engineering Division, Proceedings of ASCE, Vol. 102, No. EE2, p 449-463, April, 1976. 8 fig, 4 tab, 9 ref, 2 append.

Descriptors: *Waste water treatment, *Analytical techniques, *Microorganisms, *Nitrification, *Waste water(Pollution), Oxidation, Rates, Nitrites, Cultures.
Identifiers: *Mixed liquor.

A technique was developed to estimate the concentration of active nitrifying organisms in waste water mixed liquor. The oxidation rates for ammonium and nitrite in the mixed liquors were compared with those obtained with pure cultures of Nitrosomonas europaea and Nitrobacter agilis and N. winogradskyi suspended at known concentrations in a mineral salt medium containing their respective substrates. pH 7.4 to 7.9 was used as a reference to determine the rates, since this was the range where maximum rates occurred. The ratio of the specific oxidation rates of the nitrifying population of the mixed liquor and pure cultures under similar pH and temperature conditions represents the portion of the mixed liquor total Kjeldahl nitrogen (TKN) contributed by cellular TKN of autotrophic nitrifiers. This ratio yields the nitrifying organisms' TKN concentration when it is multiplied by the mixed liquor TKN concentration. The technique seems promising in aiding improved operation and design of nitrification processes and understanding the factors that affect these processes. The substrate concentrations did not affect the oxidation rates. The oxidation rates of nitrate and ammonium, at concentrations above 10 mg nitrogen/liter had zero-order kinetics. The pH influenced the oxidation rate. The pH optima were in the range of 7.4 to 7.9, and the concentration of nitrifying organisms in the system influenced the rate of oxidation. (Snyder-FIRL)

PRACTICAL ASPECTS OF ANAEROBIC DIGESTION,
Rowett Research Inst., Bucksburn (Scotland).
R. Summers, and S. Bousfield.
Process Biochemistry, Vol. 11, No. 5, p 3-6, June, 1976. 1 fig, 2 tab, 18 ref.

Descriptors: *Waste water treatment, *Sewage treatment, *Sewerage, *Treatment facilities, *Anaerobic digestion, Waste disposal, Energy, Organic wastes.
Identifiers: Energy production, Pollutional load.

The use of anaerobic digestion for waste disposal and energy production is discussed. Historically, the process has been used to reduce the pollutional load of strong, organic wastes of various kinds; recently the energy produced has become increasingly important. Anaerobic digesters are often used to treat domestic sewage. The gas produced may be used for heating needs at the digester site or for generating electricity. Some industrial wastes are suitable for anaerobic digestion, including slaughterhouse, fruit and vegetable, alcohol fermentation, and pulp and paper wastes. Because of their strength, an aerobic digester is often used to treat such wastes on-site before discharging them into a public sewer. Farm wastes are very amenable to anaerobic digestion. Two types of anaerobic digesters are used for farm wastes: the small, warm-climate Gobar gas unit and larger, heated digesters used in temperate climates. Pilot plant tests for the larger systems showed that digestion must be built up gradually. Operational problems include greater scum formation than in domestic digesters and the need for more stirring. Even during cold weather, an aerobic digester using farm waste can produce more energy in the form of gas than is needed to run them. (Snyder-FIRL)

A SURVEY OF PHOSPHORUS REMOVAL IN WISCONSIN,
Howard, Needles, Tammen and Bergendoff, Milwaukee, Wis.
D. A. Braasch, and E. F. Joeres.
Water Sewage and Works, Vol. 123, No. 7, p 70-73, July, 1976. 8 tab, 15 ref.

Descriptors: *Waste water treatment, *Phosphorus, *Surveys, *Wisconsin, *Regulation, Costs, Evaluation, Performance, Treatment, Legal aspects, Chemical wastes, Water pollution control, Pollution abatement.

Phosphorus removal data are presented for 50 plants in the state of Wisconsin affected by the state's phosphorus removal policy. As of August 1974, 17 plants were achieving phosphorus removals from the influent exceeding 85%. Out of 50 plants providing treatment for phosphorus

removal, less than half of the plants were attaining the required phosphorus reductions. Data are also presented on the types of phosphorus removal treatment being used by each plant; however the relative merits of alternative chemicals or treatment methods are impossible to evaluate because of local treatment problems and conditions. The major cost associated with phosphorus removal methods used in Wisconsin is the chemical cost. Treatment problems resulting in high chemical doses and the temporary nature of some chemical storage and feed facilities make the treatment costs difficult to interpret and evaluate. (Kreager-FIRL)
W76-12649

WASTE-TREATMENT SYSTEM CUTS ENERGY REQUIREMENTS.
Chemical Engineering, Vol. 83, No. 16, p 57-58, August 2, 1976.

Descriptors: *Biological treatment, *Oxidation, *Energy, *Biological membranes, *Waste water treatment, Suspended solids, Biochemical oxygen demand, Materials, Efficiencies, Costs, Filtration, Sewage treatment.
Identifiers: GaryGlas treatment system.

GaryGlas, a highly porous and rigid silica biological oxidation medium, is described as an economical alternative to more complex and more energy intensive aerated sludge treatment processes. Field tests on GaryGlas treatment systems varying in size from 40,000 to 2,100,000 gallons/day indicate that the medium does not require backwashing or forced aeration for the sustenance of the biological oxidation process. The material's intended use is as a secondary filter medium, although GaryGlas can also be used in tertiary polishing filters. Though priced about three times higher than competitive secondary treatment media, GaryGlas displays removal efficiencies that are 33-80% higher for both biochemical oxygen demand and total suspended solids. GaryGlas can be contained in vessels of concrete, fiberglass, or corrosion-proofed steel; the receptacle need offer only side support and wind resistance. (Kreager-FIRL)

Descriptors: *Waste water treatment, *Reclamation, Pollutant identification, *Model studies, *Programs, Federal government, Desalination, Sea water, Brackish water, Ozone, Ultraviolet radiation, Organic compounds, Industrial wastes, Land use, Economics, Analytical techniques, Polymers, Reverse osmosis.

The United States Army Mobility Equipment Research and Development Command's program in water and waste management is reviewed. The program includes the research and development of water supply systems for the production of potable water, systems for the storage and distribution of water, well drilling equipment, equipment for the collection and treatment of waste water designed for reuse and/or disposal, portable incinerators, and watercraft for waste treatment. Specific projects underway include: the development of reverse osmosis units for the desalination of brackish and sea water, studies of the destruction of bio-refractory organic compounds in water using ozonolysis catalyzed with ultraviolet light, the development of a carbon/polymer treatment process for reclaiming laundry waste water, the identification of trace organics in water, and the development of a land use modeling program aimed at determining the most economical and environmentally compatible use of land at military facilities. CONCENTRATIONS OF NITRIFYING BACTERIA IN SEWAGES, EFFLUENTS, AND A RECEIVING STREAM AND RESISTANCE OF THESE ORGANISMS TO CHLORINATION,
Rutgers - The State Univ., New Brunswick, N.J. Dept. of Environmental Science.
P. F. Strom, V. A. Matulewich, and M. S. Finstein.
Applied and Environmental Microbiology, Vol. 31, No. 5, p 731-737, May, 1976. 2 fig, 2 tab, 27 ref.

Descriptors: *Microbiology, *Bacteria, *Waste water(Pollution), *Waste water treatment, *Chlorination, Resistance, Effluents, Microorganisms, On-site investigations, Pollutant identification, Activated sludge, Sewage, Domestic wastes, *Nitrogen fixing bacteria.
Identifiers: *Nitrifying bacteria, Most probable number technique.

Estimates of nitrifying bacteria (NH4(+) and NO2(-) oxidizers) in samples from four activated sludge plants treating mainly domestic sewage were obtained using a most probable number technique. Concentration ranges per milliliter were 1010-3880 and 79-145 in settled sewages, 32-7420 and 2-1010 in secondary effluents, and from less than 0.1 to 622 and 0.1-70 in chlorinated secondary effluents. These results indicated that nitrifiers are more resistant to chlorination than fecal streptococci. Laboratory studies with these nitrifying bacteria involving chlorine exposures of up to 2 milligrams/liter for 0-60 minutes also indicated that nitrifiers are more resistant than fecal streptococci to chlorination, with the NO2(-) oxidizers showing the greatest resistance. Below the outfall of a sewage plant that discharges heavily chlorinated unnitrified effluent, NH4(+) oxidizers amounted to approximately 20 million/gram of slime scraped from stream-bed rocks. The figure upstream of the outfall was about 300,000/gram. (Kreager-FIRL)

PHYSICOCHEMICAL WASTEWATER TREATMENT METHODS, (IN GREEK),
M. A. Delichatsios.
Texnika Xponika, Vol. 44, No. 5, p 227-230, 1975. 3 fig, 9 ref.

Descriptors: *Waste water treatment, *Biological treatment, *Treatment facilities, *Coagulation, *Adsorption, *Sedimentation, Suspended solids, Organic matter.
Identifiers: *Physico-chemical treatment.

Physico-chemical methods of waste water treatment use coagulation and sedimentation to remove suspended solids, and carbon adsorption columns to remove organic matter. Compared with biological treatment methods, these methods operate reliably for varying qualities of waste water and have improved economy and efficiency. The basic laws in such a system with respect to the phenomena of coagulation, breakup and sedimentation of the suspended solids in turbulent flows have been developed. Knowledge of these laws leads to intelligent design of systems for waste water treatment. A new system using coagulation in turbulent pipe flows was proposed with the advantage of substantially reduced space requirements compared with traditional system (Snyder-FIRL)

A FRESH APPROACH TO MICROSTRAININ
D. L. B. Arnold.
Filtration and Separation, Vol 13, No 3, p 272- May-June, 1976. 8 fig, 1 tab.

Descriptors: *Waste water treatment, *Sew treatment, *Sewerage, *Filters, *Filtrat Fabrics, Suspended solids, Efficiencies, Po Size.
Identifiers: *Microstraining.

In microstraining, water is strained under a differential head through a fine woven fabric rotating drum. The suspended matter retaine the mesh contributes to straining efficiency b fectively reducing the size of the pores in fabric. Microstrainer design is discussed, inclu construction, fabric panels, backwashing, dri system, hydraulics, structure and housing. F fabrics are usually made of stainless steel

UNIVERSITY OF ILLINOIS-URBANA-CHAMPAIGN

where the possibility of corrosion exists, plastic. The aperture,size is usually between 20 and 40 microns. The removal efficiency is determined by the mechanics of mat formation. Microstraining is used for water supply after treatment as well as for tertiary treatment of biologically purified sewage, generally after sedimentation. The Filtester, a small, inexpensive device, can be used to determine the capacity of a microstrainer. It filters a sample of the water to be treated through a piece of clean microfabric, determining the volume of water filtered in a time interval corresponding to the submersion time of an element of microfabric in normal microstrainer operation. RECOVERY OF P205 FROM WASTE-WATERS BY ADDING LIME (SEKKAI SHORI NI YORU HAISUICHU NO P2O5 NO KAISHU),
M. Mori.
Kekko to Sekkai, (Gypsum and Lime), No 142, p 111-113, May, 1976. 3 fig, 2 tab, 4 ref.

Descriptors: *Waste water treatment, *Phosphorus compounds, *Waste water(Pollution), *Lime, *Chemical wastes, Laboratory tests, Chemical analysis, *Chemical precipitation, Fluorine, Crystals, Solubility.
Identifiers: *Phosphorus pentoxide recovery.

Adding lime to recover phosphorus pentoxide in waste water from wet process phosphoric acid plants was studied by means of laboratory tests. The products were also analyzed. Prior to phosphorus pentoxide precipitation, most of the fluorine was precipitated as calcium fluoride at pH 3 to pH 4; the remainder of the phosphoric acid was then precipitated as fine apatite crystals. The size of the apatite crystals varied with the amount of fluorine in the waste water. Although citrate solubility varied with the crystal size, all of the apatite was entirely soluble in a 2% solution of citric acid. (Snyder-FIRL)

FLOTATION: TWO FRESH WAYS TO TREAT EFFLUENTS,
Imperial Chemical Industries, Ltd., London (England).
D. B. Chambers, and W. R. T. Cottrell.
Chemical Engineering, Vol 83, No 16, p 95-98, August 2, 1976. 2 fig, 5 tab.

Descriptors: *Waste water treatment, *Flotation, *Bubbles, *Electrolysis, Industrial wastes, Suspended solids, Lipids, Biochemical oxygen demand, Oil wastes, Efficiencies, Sludge treatment, Flocculation.
Identifiers: *Microflotation, *Electroflotation.

The treatment of waste water with electroflotation and microflotation techniques is discussed. Electroflotation, which involves the generation of bubbles by electrolysis, is especially recommended for low flow rates (less than 25 cu m/hr). Data compiled from 20 electroflotation units that treat industrial effluents in the United Kingdom indicate that electroflotation is a practical, first-stage treatment for reducing suspended solids, fats, and biochemical oxygen demand as well as for sludge thickening. Microflotation, which is a dissolved-air flotation technique, combines the benefits of advanced chemical flocculation with a novel and simple method for generating air bubbles which leads to the removal of solids, fats, and oils by flotation. In addition to its simplicity and ease of operation, microflotation requires little space. Large interfering air bubbles are absent, and solids removal is usually in excess of 99%. About 19 full-scale plants are operating in Sweden, and others are under construction in Finland, Norway, the United Kingdom, and Japan. (Kreager-FIRL)

RECENT DEVELOPMENTS IN SEWAGE TREATMENT AND EQUIPMENT,
G. E. Thompson, and G. J. Maguet.
Water and Pollution Control, Vol 114, No 7, p 28, 30-33, July, 1976. 5 fig, 9 ref.

Descriptors: *Waste water treatment, *Sewage treatment, *Biological treatment, Physical control, *Activated sludge, *Disinfection, Trickling filters, Lime, Iron compounds, Chlorides, Nitrification, Denitrification, Ozone, Radiation, Efficiencies, Equipment, Performance, Gamma rays, *Canada.
Identifiers: Rotating discs, Alum, Ferric chloride, Physico-chemical treatment, Bromination.

Improvements in sewage treatment methods and equipment are reviewed. Improved tank designs for primary clarification have resulted in increased organics removal and virtual elimination of short circuiting. The use of pure oxygen instead of air in biological treatment schemes is a process improvement which is typified by low retention times, excellent removal efficiencies, and excellent sludge characteristics. The use of deep tanks (up to 22 ft) in activated sludge processes has resulted in transfer efficiencies up to 100% greater than those previously achieved with virtually identical aeration equipment. The rotating biological contactor, which is a modification of the trickling filter process, is typified by extremely low power requirements and excellent reaction to shocking. Physico-chemical treatment processes involving waste water treatment with chemicals such as lime, alum, and ferric chloride are compact and provide high-grade treatment. The introduction of the nitrification-denitrification step into the treatment of waste water for nutrient removal represents a new process addition to the sewage treatment plant. Other new treatment processes in the field of disinfection include: ozonation, bromination, and gamma radiation. (Kreager-FIRL)
W76-12662

DIGESTION OF AQUEOUS WASTES WITH OXYGEN PRESSURE-RECYCLING OXIDATION SEWAGE TREATMENT,
Polytechnic Inst. of New York, Brooklyn. Dept. of Chemical Engineering.
D. F. Othmer.
Process Biochemistry, Vol 11, No 5, p 8-10, 17, June, 1976. 1 fig, 5 ref.

Descriptors: *Waste water treatment, *Sewage treatment, *Sewerage, *Treatment facilities, *Digestion, Waste water(Pollution), Liquid wastes, Oxygen, High pressure, Recycling, Oxidation.

Oxidation of wastes is due to strictly chemical action, enzymatic action, and biochemical action. Both biochemical and enzymatic influences on oxidation are lost at temperatures much above the ambient, but the chemical action is substantially increased at high temperatures and pressures. A number of considerations favor the use of oxygen or oxygen-enriched air in the aerobic digestion of sewage waters. In the best known system using oxygen at atmospheric pressures, several covered conventional aerated digestor tanks are connected for liquid flow and for gas flow in the space above the liquid. Several sewage treatment systems have been used which use increased pressure to dissolve oxygen from air more rapidly. In an improved method using higher pressures, the pressurized waste waters are depressurized after using the oxygen dissolved in them, releasing other dissolved gases. More oxygen is then dissolved by pressurizing the waste waters again with air or oxygen. In one system that can be used for this pressure-recycling oxidation sewage treatment, the aerated influent sewage enters the inner cylinder which also acts as a digester for the organics. The liquid overflows the top of the inner cylinder, and, in the space outside the cone, flocculation and settling of solids and clarification of the liquid take place. This system may act as a complete sewage treatment plant, especially in small sizes. It may also be incorporated with other conventional equipment and processing in larger industrial or municipal plants. (Snyder-FIRL)

BULKING CONTROL MADE EASY - WITH HYDROGEN PEROXIDE,
FMC Corp., Princeton, N.J.
W. G. Strunk, and J. Shapiro.
Water and Pollution Control, Vol 114, No 7, p 10, 12, 14, 15, 40-41, July, 1976.

Descriptors: Analytical techniques, *Activated sludge, *Microenvironment, *Microscopy, *Microbiology, Bacteria, Protozoa, Microorganisms, *Waste treatment, Oxidation.
Identifiers: *Hydrogen peroxide, *Sludge bulking control.

A visual means for predicting potential bulking situations with activated sludge systems and for pinpointing the time at which hydrogen peroxide treatment should begin is described. Sludge bulking involves failure of the sludge to settle adequately, with suspended solids passing out with the effluent. This is most frequently caused by the growth of filamentous bacteria which are susceptible to oxidative attack by hydrogen peroxide. When bulking is imminent, changes occur in the animal and bacterial life in the sludge that can be observed by microscope. Filamentous bacteria can be seen at 100 power magnification when bulking is imminent but are rare in a sludge which compacts and settles readily. Protozoa are also easily observed at 100 power magnification and are the best index of the health of activated sludge. Microscopic observations of four distinct stages of microbiological activity as sludge goes from a healthy state, through incipient bulking, to full bulking, and back to the healthy state are described. Corrective action with hydrogen peroxide is recommended as soon as the initial growth of filamentous bacteria is observed. (Kreager-FIRL)

THE OPERATION OF A SIMPLEX ACTIVATED SLUDGE PILOT PLANT IN AN ATMOSPHERE OF PURE OXYGEN, PART 2,
L. B. Wood, R. P. King, M. K. Durkin, H. J. Finch, and D. Sheldon.
The Public Health Engineer, Vol 4, No 3, p 67-75, May, 1976. 13 fig, 3 tab, 20 ref.

Descriptors: *Waste water treatment, *Activated sludge, *Pilot plants, *Oxygen, *Atmosphere, Air, Oxidation, Ammonia, *Treatment facilities.

Discussion is continued of a study of the use of oxygen to replace air in the activated sludge process, particularly with respect to more rapid oxidation of the carbonaceous substrate, more rapid oxidation of ammonia, and the production of smaller quantities of activated sludge with better settling characteristics and higher solids content. There was no evidence of a higher rate of carbonaceous substrate removal on a kinetic basis. Nevertheless, high dissolved oxygen concentrations are attainable, and higher mixed liquor solids can be maintained at higher plant loadings. The maximum growth rate of Nitrosomonas can be reduced in single-stage systems by low pH in mixed liquor where the latter is enclosed with oxygen, and carbon dioxide is allowed to build up in the gas space. No acclimatization to low pH is apparent. There is no reduction in the quantity of sludge produced. The growth rate associated with organisms oxidizing carbonaceous substrate is similar to that with air-based sludge yield. There was no evidence of increased sludge removal by endogenation and lysis. No special advantage was revealed by the settlement of the sludge as measured by the standard procedure and used for calculation of linear settlement rate. High sludge density indices apparently did not develop. (See also W76-09669) (Snyder-FIRL)

ESTIMATING THE RELIABILITY OF ADVANCED WASTE TREATMENT - PART 2,
Southwest Ohio Regional Computer Center, Cincinnati.
R. B. Dean, and S. L. Forsythe.
Water Sewage and Works, Vol. 123, No. 7, p 57-60, July, 1976. 7 fig, 2 tab, 18 ref.

Descriptors: *Tertiary treatment, *Statistical methods, *Reliability, *Treatment facilities, *Estimating, Biochemical oxygen demand, Chemical oxygen, Turbidity, Coliforms, Chlorine, Data collection, *Waste water treatment.

Statistical estimates of the long-term reliability of advanced waste treatment plants are discussed based on daily operating data covering six years of continuous operation at a waste treatment plant plus shorter records from other plants. Topics discussed include: artifacts produced by the logarithmic conversion of data, errors resulting from confusing the median with the mean when reporting data, and the probability of exceeding any finite upper limit when the performance of a plant obeys normal or lognormal statistics. The decision as to how specifications should be set is seen as being based on the effects of violations and, ultimately, on the internal cost of compliance in comparison with the external cost of violation. Examples of logarithmic plots of data are illustrated for biochemical oxygen demand, chemical oxygen demand, turbidity, coliform count, and residual chlorine. (Kreager-FIRL)

OPTIMIZE THE EFFLUENT SYSTEM - PART 4: APPROACH TO CHEMICAL TREATMENT,
Standard Oil Co., Chicago, Ill.
J. F. Grutsch, and R. C. Mallatt.
Hydrocarbon Processing, Vol. 55, No. 6, p 115-123, June, 1976. 18 fig, 4 tab.

Descriptors: *Oil industry, *Waste water treatment, *Colloids, *Suspended solids, *Optimization, Silica, Electrolytes, Analytical techniques, Ions, Neutralization, Chemical reactions, Sulfides, Salinity, Lagoons, Aeration.
Identifiers: *Chemical treatment.

Methods for optimizing the treatment of petroleum refinery effluents are discussed. Examples and case histories are presented for the following four collidal systems: dispersed silica, suspended matter in API separator effluent, biocolloids in fresh water aerated lagoon effluent and biocolloids in brackish water aerated lagoon effluent. Specific topics covered include: the response of colloidally dispersed silica to destabilization chemicals and an indifferent electrolyte; the comparative effectiveness of cationic polyelectrolytes for the charge neutralization of suspended matter in API separator effluents as determined by zeta potential titration curves; polyelectrolyte synergisms and antagonisms in salinity, pH, and sulfides in API separator effluents; the comparative effectiveness of cationic polyelectrolytes for the charge neutralization of biocolloids in aerated lago on effluent; and the determination of optimal chemical treatment for biocolloids in brackish waters using zeta potential measurements at low specific conductance to insure that charge neutralization is the predominant destabilization mechanism. (Kreager-FIRL)

OXYGEN ACTIVATED-SLUDGF SYSTEMS--I., TECHNICAL REVIEW OF THF USE OF OXYGEN IN THE TREATMENT OF WASTE WATER,
Water Pollution Research Lab., Stevenage (England).
A. G. Boon.
Water Pollution Control, Vol. 75, No. 2, p 206-213, 1976. 1 fig, 2 tab, 34 ref.

Descriptors: *Oxygen, *Sewers, *Activated sludge, *Waste water treatment, *Aerobic treatment, Biological treatment, Treatment facilities, Water quality control, Rivers, Treatment, Evaluation, Biochemical oxygen demand, Sludge, Lagoons, Nitrification.

Advantages and disadvantages associated with the use of oxygen in waste water treatment applications involving activated sludge processes, river protection, and the maintenance of aerobic conditions in rising-main sewers are discussed. Waste waters containing high biochemical oxygen demand concentrations (greater than 1000 mg/liter) can be treated very economically with oxygen activated sludge processes. Moreover, the settleability of sludge from oxygenated plants is better than that of sludge from air activated sludge plants, and the volume of surplus sludge is lower with oxygen processes. The injection of oxygen to maintain aerobic conditions in rising-main sewers is in some cases economically more advantageous than the use of air injection. Oxygen can be used to increase the oxygenation capacity of treatment plants, rivers, or lagoons in emergency situations at a lower cost than that associatd with aeration systems. Disadvantages connected with the use of oxygen include: increased complexity, increased energy consumption, difficulties associated with achieving nitrification in oxygenated activated sludge plants, and the hazards connected with storing and using oxygen. (Kreager-FIRL)

UK WORK ON THE USE OF OXYGEN IN THE TREATMENT OF WASTE WATER, ASSOCIATED WITH THE CCMS ADVANCED WASTE WATER TREATMENT PROJECT, (II).
Department of the Environment, London (England). Directorate General Water Engineering.
N. Banks.
Water Pollution Control, Vol. 75, No. 2, p 214-220, 1976. 8 tab, 3 ref.

Descriptors: *Activated sludge, *Oxygen, *Oxidation, *Sewage treatment, Pilot plants, On-site investigations, Biological treatment, Treatment facilities, Sludge, Nitrification, Treatment, Evaluation, Performance, *Waste water treatment.
Identifiers: United Kingdom, Settling characteristics.

Pilot plant studies dealing with the use of oxygen activated sludge treatment of waste water are reported for a number of sewage treatment facilities throughout the United Kingdom. Oxygen plants appear to be capable of carbonaceous removal at rates higher than those of air plants of comparable size, thus offering land use and cost advantages. Oxygen plants also appear to produce reduced amounts of surplus sludge, and oxygen-produced sludge possesses better settling characteristics than does air-produced sludge. Nitrification is inhibited in enclosed oxygen reactors; however, the resultant effluents can be successfully nitrified in a second stage using air. (Kreager-FIRL)

DEVELOPMENT IN THE APPLICATION OF OXYGEN IN THE ACTIVATED-SLUDGE PROCESS IN THE FEDERAL REPUBLIC OF GERMANY, (III).
Technische Universitaet, Munich (West Germany).
W. Hegemann, and W. Bischofsberger.
Water Pollution Control, Vol. 75, No. 2, p 221-226, 1976. 2 fig, 4 tab, 10 ref.

Descriptors: *Activated sludge, *Oxygen, *Oxidation, *Waste treatment, Sludge, Domestic wastes, Industrial wastes, Treatment facilities, Biomass, Physical properties, Evaluation, On-site investigations, Performance.
Identifiers: Sludge volume index, Settling characteristics, Oxygen activated sludge.

The treatment of domestic and industrial waste with an oxygen activated sludge process was investigated at a number of waste treatment plant throughout West Germany. Retention periods in oxygenation tanks were shorter due to higher decay rates with oxygen activated sludge operation. Lower biomass loadings were also observed for a given tank size, implying that smaller tank volumes are possible with the oxygen activated sludge process. Specific surplus sludge production was reduced with the oxygen process, with solid production amounting to only about 50% of that associated with conventional air plants. The settleability of most oxygen sludges, as indicated by the sludge volume index, was better than that of air sludges. The oxygen process appeared to be inadequate, however, in applications where nitrification was required. (Kreager-FIRL)

OUTLOOKS FOR THE FUTURE OF DEEP WELL DISPOSAL,
SCS Engineers, Reston, Va.
E. T. Conrad, and N. E. Hopson.
Water Resources Bulletin, Vol 11, No 2, p 370-378, April 1975. 1 fig, 4 tab, 6 ref.

Descriptors: Wells, *Waste disposal, *Waste disposal wells, Wastes, Groundwater, *Deep wells, *Water quality standards, Water pollution control, Waste water disposal.

A rationale is presented for estimating the quantities of industrial waste that may be disposed of by deep well injection. Deep well injection refers to disposal to a saline aquifer (not a potable water supply) and does not include injection of oil field brine. Literature discussing regulation and curtailment of deep well injection of industrial wastes presents the argument that little is known about this method. Industrial wastes have been disposed of by deep well injection for less than 20 years and there are only 216 such wells in the United States, of which only 162 are currently operating. However, related experience has been gained from disposal of oil field brine by injection. There are more than 40,000 deep wells now being utilized for this purpose. The various issues are discussed in relation to the Federal Water Pollution Control Act of 1972; and estimates based on increased use of deep well injection by major industries are projected. ULTIMATE DISPOSAL OF BIOLOGICAL SLUDGES -- A NOVEL CONCEPT,
B.C. Research, Vancouver.
E. G.-H Lee, J. C. Mueller, and C. C. Walden.
Pulp and Paper Canada, Vol. 77, No. 6 p 88-90, 92-95 (T104-110), June, 1976. 8 fig, 17 ref, 4 tab.

Descriptors: *Sludge disposal, *Activated sludge, *Pulp wastes, Biological treatment, Oxidation, Hydrolysis, Recycling, Effluents, Costs, Estimated costs, Wastes, Industrial wastes, Waste treatment, Water pollution sources, Water pollution treatment, Suspended solids, Sludge, Solid wastes, Sodium compounds, *Ultimate disposal.
Identifiers: Kraft mills, Sodium hydroxide.

The disposal of sludges from activated sludge systems involves digestion in 0.1 N NaOH for 2 hr at 50-70 C, recycling the hydrolyzate to the biosystem, and complete biological oxidation to carbon dioxide and water. Results of tests with kraft mill effluents indicate that the process reduces approximately 5-fold the amount of sludge requiring ultimate disposal. Treatment costs are estimated at $1.81/air-dry ton of pulp. Additional benefits of this process include improvement of sludge settleability and low suspended solids in clarified effluents. (Sykes-IPC)

COLESHILL (2): INCINERATING SEWAGE SLUDGE,
Water, No. 8, p 23-24, May, 1976. 1 fig.

Descriptors: *Sludge treatment, *Sludge disposal, *Incineration, *Dewatering, *Treatment facilities, Waste treatment, Equipment, Sewage sludge, Sewage treatment.
Identifiers: United Kingdom.

A description of the Severn Trent Water Authority's sewage sludge incineration plant at Coleshill, England is provided. The plant handles sludge from sewage treatment plants in the area which amounts to about 3500 cu m/day. The sludges which contain about 95% water are initially passed through mechanically raked screens for removal of gross solids and are then directed to storage tanks where they can be held, mixed, or transferred. The sludges are next chemically treated to assist dewatering and are stirred and air-agitated to ensure thorough mixing. After conditioning, the sludge is dewatered by pressure to produce a solid sludge cake containing 65% moisture. The sludge cake is incinerated in two of three furnaces which operate at any one time. The liquid produced by dewatering is pre-treated at the incinerator so that it may be processed with normal sewage at the nearby sewage treatment plants. (See also W76-12609) (Kreager-FIRL)
W76-12610

COMPACT INCINERATOR FOR SOLID AND LIQUID WASTES.
Processing, Vol. 22, No. 5, p 33, May, 1976. 1 fig, 1 tab.

Descriptors: *Sludge disposal, *Sewage disposal, *Oil wastes, *Incineration, Waste disposal, Equipment, Solid wastes, Liquid wastes, Sludge.

A small, self-contained incinerator known as the 'Furnapak' which incorporates several design features of larger multiple hearth furnaces is available for applications involving the burning of sewage screening, oily wastes, and sewage sludges. The incinerator uses a rotating rabble shaft and air injection in a manner similar to multiple hearth furnaces. Both solid and liquid wastes can be incinerated either simultaneously or independently. Solid waste is loaded manually onto a solid bowl refractory hearth through an air-operated door large enough to accommodate standard refuse sacks. Liquid wastes and pumpable sludge are introduced into the incinerator through a tangentially mounted inlet port. Problems of burner blockage are avoided by the use of a simple weir type burner in which the fuel falling over the weir is atomized by low pressure air from the main combustion air fan. Any mixture of waste oil, oily water, sewage, and other sludges containing solids particles up to 0.5-inches in size can be handled efficiently. The incinerator is capable of feed rates up to 350 kilograms/hour for feeds containing up to 80% moisture. (Kreager-FIRL)

SOD PRODUCTION: AN EXPERIMENT IN SLUDGE DISPOSAL,
Florida Public Works Administration, St. Petersburg.
W. T. White, Jr.
Public Works, Vol. 107, No. 6, p 104-106, June, 1976. 2 fig, 1 tab.

Descriptors: *Turf, *Sludge disposal, *Sludge, *Topsoil, *Land use, Mixing, Grasses, Tile drainage, Soil types, Ditches, Solid wastes, Moisture, Waste disposal.
Identifiers: Sandy soils, Land application, Sod production.

A project was begun in St. Petersburg, Florida, to use sludge from waste water treatment plants to develop topsoil and eventually grow sod for city parks and recreation areas. Sludge was distributed into furrows dug by a tractor and then blended with the soil using a tractor attachment. During the first yr, an 18 inch layer of topsoil was created which produced superior grass growth when transferre to city parks and street parkways. A 23-acre area was used. The site was completely tile drained at an average depth of 3.5 ft. The sandy soil had an interference of shell commencing at a depth of about 24 inches. The area was bordered by a 6 ft deep drainage ditch whose contents were pumped to a holding pond south of the site. Sludge solids were retained at the soil surface, part of the moisture evaporated, and any excess was collected bydrain tile and carried to the drainage ditch. Sludge spraying was discontinued for 3 days after a heavy rain, because an inch of rain contributed moisture equivalent to 3 days of operation. (Snyder-FIRL)

ALUM SLUDGE DRYING WITH BASIC EXTRACTIVE TREATMENT,
Resources Conservation Co., Renton, Wash.
R. L. Olson.
American Water Works Association Journal, Vol. 68, No. 6, p 321-323, June, 1976.1 fig, 2 tab.

Descriptors: *Sludge, *Drying, *Sludge treatment, *Solvents, *Organic matter, Inorganic compounds, Dewatering, Economics, Suspended solids, *Waste treatment.
Identifiers: *Basic extractive sludge treatment.

A new system has been developed to reduce problem sludges, including alum, to a dry state suitable for recycling or landfilling. The method called B.E.S.T. (basic extractive sludge treatment), utilizes a solvent with unique properties that conditions both organic and inorganic sludges while enhancing the solids' dewatering and separation properties. The overall relative economics of the process depend on the specific sludge to be processed, the nature of existing alternatives for sludge disposal, and the availability of existing component hardware that can be incorporated into it. The process can satisfy all applicable Enviro

LIBRARY OF THE UNIVERSITY OF ILLINOIS AT URBANA-CHAMPAIGN

mental Protection Agency (EPA) guidelines. When a combination of the solvent and water is cooled below approximately 65 F, they become completely mixed, whereas suspended solids contained in a liquid mixture are easily separated mechanically. Raising the liquid temperature to approximately 140 F allows the water and solvent to be separated by decanting. A Mini-B.E.S.T. unit was tested with various sludges to test the validity of the system. All system design goals were met during this testing. When the system was tested with alum sludge, the 52% liquid remaining in the filter cake was all solvent. The solvent has an evaporative value of 135 Btu/lb as opposed to approximately 1000 Btu/lb for water, resulting in one of the major energy economies in the B.E.S.T. system. The Mini-B.E.S.T. system was able to remove over 99% of the suspended solids from an organic sludge slurry and deliver 95% or more dry, pathogen-free solids and a clear, sterile effluent. Energy requirements are relatively low and environmental impact is negligible. (Snyder-FIRL)

PHILADELPHIA SLUDGE: WHERE TO PUT IT.
Civil Engineering-ASCE, Vol 46, No 6, p 60-62, June, 1976.

Descriptors: *Sewage treatment, *Sludge disposal, *Ultimate disposal, *Pennsylvania, *Sewage sludge, Atlantic Ocean, Land use, Oceans.
Identifiers: *Philadelphia(Penn).

Philadelphia dumps at least part of its sewage sludge in the open ocean, but the Environmental Protection Agency (EPA) has ordered it to discontinue this practice by 1981. Increased mercury, nickel, lead, and nitrate concentrations have been detected at the dumpsites. There was no apparent evidence of accumulation of organics and nutrients or changes in phytoplankton populations. Philadelphia officials believe that the dumping should not be banned. They are, however, evaluating 10 treatment-disposal alternatives. These include giving away the dried sludge for use as a fertilizer. A Recycling Center may also be set up to handle sludge for shipment. Sludge will be applied on a trial basis to farmland south of the city. Use of sludge to reclaim strip-mined lands has also been considered. Because of expected objections, Philadelphia will cooperate with several universities in studying sludge application to strip-mined land. In similar tests using Scranton sludge, the alkaline sludge helped neutralize the acidic strip-mined land and added humus. (Snyder-FIRL)

ALUM RECOVERY AND WASTE DISPOSAL IN WATER TREATMENT,
Metcalf and Eddy, Inc., New York. (Assignee).
G. P. Fulton.
U. S. Patent No. 3,959,133, 4 p, 3 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 946, No 4, p 1739, May 25, 1976.

Descriptors: *Patents, *Water treatment, *Water purification, *Water quality control, Treatment facilities, Sludge treatment, Sludge disposal, Suspended solids, Coagulation.
Identifiers: *Alum(Aluminum sulfate) recovery.

In water treatment plants, particularly for large municipalities, alum (aluminum sulphate) is commonly used in the coagulation and clarification process. During the treatment the alum is converted essentially to aluminum hydroxide. The aluminum hydroxide, together with suspended solids including suspended matter in the raw water, precipitates resulting from the treatment process, additives, etc form a sludge which must be disposed of. The invention is directed to the provision of a water treatment system and process which normally utilizes alum recovery and yields a neutral cake for convenient disposal, provides for periodic elimination of contaminated recovered alum, and permits operation without alum recovery when required by abnormal conditions. APPARATUS FOR BIOLOGICAL AND CHEMICAL PURIFICATION OF WATER BY AGGLOMERATION,
Agrotechnika, narodny podnik, Zvolen (Czechoslovakia). (Assignee).
S. Mackrle, and V. Mackrle.
U. S. Patent No. 3,959,144, 5 p, 6 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 946, No 4, p 1743, May 25, 1976.

Descriptors: *Patents, *Water purification, Water quality control, *Biological treatment, Chemical reactions, Flocculation, *Separation techniques, *Water treatment, Waste water treatment, Equipment.
Identifiers: *Chemical treatment, *Separation tanks.

A water purification plant composed of standard elements is arranged in such a way that all the spaces are formed for either chemical or biological water purification. The arrangement is composed of at least two tanks with substantially cylindrical mantles aligned side by side horizontally and with their axes parallel. Adjacent tanks, whose length is larger than their diameter, are mutually connected by inclined walls placed tangential to the mantles of the tanks. Inclined walls, adjacent upper parts of the mantles of the tanks and front and rear walls determine a separating space for the separation of the floccular suspension from the purified water. TECHNIQUE FOR CONTINULUSLY ANALYZING THE CONCENTRATION OF OZONE DISSOLVED IN WATER,
Fischer and Porter Co., Warminster, Pa. (Assignee).
J. J. Morrow, and L. L. Dailey.
U.S. Patent No. 3,960,673, 4 p, 4 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 947, No 1, p 294, June 1, 1976.

Descriptors: *Patents, *Water purification, *Water treatment, *Water pollution treatment, *Ozone, Disinfection, Oxidation, *Monitoring, Measurement, Instrumentation, Cathods, Anodes, Pollutant identification.

Ozone is extensively used in the purification of drinking water, the treatment of sewage and industrial wastes, as well as in various chemical manufacturing processes. To attain an effective germicidal action serving to destroy pathogens and all harmful bacteria and to react with oxidizable organic or inorganic chemical traces present in water, it is essential that the ozone concentration be in a predetermined range, such as 0.1 to 1 ppm. Below this range, the concentration is inadequate for its intended purpose. A technique is described for continuously indicating the concentration of ozone dissolved in water. Use is made of an amperometric cell, preferably formed of a gold cathode concentrically placed within a tubular copper anode to define an annular passage, the cathode being rotated at high speed. A sample stream of water is directed through the passage at a predetermined flow rate whereby in the absence of dissolved ozone, the cathode is polarized, but in the presence of it, depolarization takes place to cause a current to flow in the cell. The current is measured to provide a reliable and continuous reading of ozone concentration. (Sinha-OEIS)

OPTIMAL TIMING AND SIZING OF A CONJUNCTIVE WATER SUPPLY AND WASTEWATER SYSTEM, USING NONLINEAR PROGRAMMING,
California Univ., Los Angeles.
M. E. Mulvihill.

Available from University Microfilms, Inc., Ann Arbor, Mich., 48106. Order No. 73-18641. Ph. D. Thesis, 1973, 134 p.

Descriptors: *Mathematical models, *Water supply, *Waste water treatment, Water reuse, Planning, Water quality, Algorithms, Linear programming, *Water treatment, Model studies, Optimization.

A mathematical model of a conjunctive urban water supply and waste water system, consisting of the minimization of a concave objective function subject to linear constraints, has been formulated and applied to the City of Los Angeles. The objectives are: to minimize the cost of supplying water from several sources, including the provision for recycling reclaimed water; and, to determine the capacity expansion schedule of the water and waste water treatment processes. A multilevel solution technique is developed to determine the minimum cost alternative for a selected planning horizon. The first level of the algorithm is an iterative process in which the objective function is successively linearized and a series of linear programs is solved. When this yields no improvement, the second level, a search of neighboring extreme points, is initiated. If there is an improvement at this level, the procedure returns to the first level and continues. The model and solution technique were successfully applied to an actual case and the results can be used as an aid in the comprehensive planning of the system. The mathematical model is flexible in that it can be expanded to include additional water quality constituents, advanced waste water treatment processes, and variations in water quality standards. ECONOMIC COSTS OF CONTROLLING WATER QUALITY THROUGH MANAGEMENT OF IRRIGATION RETURN FLOWS,
Washington State Univ., Pullman. Coll. of Agriculture.
G. H. Pfeiffer, and N. K. Whittlesey.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-257 517, $4.50 in paper copy, $3.00 in microfiche. Completion Report, August 1976. 58 p, 6 fig, 16 tab, 17 ref. OWRT B-059-WASH(2). 14-31-0001-5125.

Descriptors: Economics, *Water quality control, Irrigation, *Return flow, Nitrogen, Water temperature, Sediments, *Water management(Applied), Model studies, *Alternative costs, Water policy, Cost analysis, *Pollution abatement.

This study focuses on the economic and social costs of alternative policies that could be used to control water quality through management of irrigation return flows. Three environmental quality parameters associated with irrigated agriculture were singled out for analysis. These parameters were river water nitrogen concentration, river water temperature and loss of sediment from irrigated farms. A dual simulation and linear programming model was used as the vehicle of analysis. Policies considered for analysis included taxing water and nitrogen inputs, reducing water rights, and improved management techniques. Results indicated that improvement of water quality in the study area is possible through the control of agricultural inputs and activities. Improvement of the receiving water to a point suitable for most uses could reduce farm income 16 to 41 percent, depending on the policy employed. A trade-off existed between economic efficiency and distribution of abatement costs. Policies that relied on higher input prices for rationing tended to more efficiently allocate resources than policies that set arbitrary input use quotas. However, these more efficient policies having low total social costs also imposed higher costs on agriculture. The results indicate that considerable improvement in water quality is possible, perhaps 50 percent of that desired, at very little cost to agriculture or the public. Better management and more efficient irrigation methods could achieve this level of abatement very cheaply. Higher levels of abatement, however, become very expensive.

ENVIRONMENTAL ANALYSIS FOR BAHAMAS SUPERTANKER PORT,
Erindale College (Ontario).
W. Harrison.
In: Coastal Engineering Conference. Fourteenth. Proceedings, held in Copenhagen, Denmark, June 24-28, 1974, Vol III, Chap. 151, p 2551-2567, 1974. 9 fig, 11 ref.

Descriptors: *Environmental effects, *Oil spills, *Oil pollution, Water resources, *Resource development, Continental Shelf, Ports, Winds, Currents(Water), Aquatic drift, Atlantic Ocean, Water pollution sources.
Identifiers: *Outer Continental Shelf, *Superports, Supertankers, Wind effects, *Bahama Islands.

From the point of view of the Bahamian environment, the most favorable locations for a supertanker port are the western margin of the Great Bahama Bank; the western shores of Grand Bahama Island; and the western margin of Little Bahama Bank. A port in any of these areas would (1) usually be located down-wind and down-current of the majority of Bahamian islands and shallows, (2) be located adjacent to boundary currents, especially the Florida Current, that would tend to carry large accidental oil spills away from coastal areas and into the North Atlantic, and (3) be located where wave energies would be relatively low, and (4) be positioned close to sea-lanes, obviating supertanker penetration of the central Bahamas. A site 30 miles east of Freeport, Grand Bahama Island, was chosen for construction of a sea-island supertanker bunker. Six controlled spills (270 U.S. gals. each) of crude and two spills of naptha were made at the sea-island site during the windiest month (February). Slick spreading rates are presented. Cumene and all lower-boiling aromatics disappeared within the first 90 minutes after a crude-oil spill; a majority of toxic fractions (BP < 220 deg C) disappeared within 3 to 8 hours. Slick-drift roses for extreme-wind-persistence and strongest-coastal-current conditions indicate the environmental suitability of the site for capture and cleanup of small spills (< 1000 gal.). (See also W76-12221) (Sinha-OEIS)
W76-12222

ENVIRONMENTAL PROBLEMS ASSOCIATED WITH A PIPELINE LANDFALL IN COASTAL DUNES AT CRUDEN BAY, ABERDEENSHIRE, SCOTLAND,
Aberdeen Univ. (Scotland).
W. Ritchie.
In: Coastal Engineering Conference. Fourteenth. Proceedings, held in Copenhagen, Denmark, June 24-28, 1974, Vol III, Chap. 152, p 2568-2580, 1974.

Descriptors: *Environmental effects, *Pipelines, *Resources development, Water resources, *Oil industry, Continental Shelf, Coasts, Bays, Dunes, Beaches.
Identifiers: *Outer Continental Shelf, Environmental impact, North Sea, Scotland, Pipeline landfall.

The first oil pipeline from the North Sea area reached Scotland in 1973. The landfall, at Cruden Bay, Aberdeenshire, is a sediment-filled, bay-head beach with coastal dunes. Environmental and landscaping problems arose with the trenching of the beach and dune areas. Various methods, including flexible fence construction, spraying wi

UNIVERSITY OF ILLINOIS-CHAMPAIGN

a bitumen compound and spreading of soil over vulnerable areas, protected the site successfully. Full revegetation took place later and the beach and dune area are now restored to their original condition. Environmental management techniques were designed to preserve the high amenity and ecological status of the site and minimise the risk of side-effects, both during and after engineering work. ENVIRONMENTAL CONSIDERATIONS OF OFFSHORE GENERATING STATIONS,
Public Service Electric and Gas Co., Newark, N.J.
R. Roney.
Ocean 72, IEEE International Conference on Engineering in the Ocean, held Newport, Rhode Island, September 13-15, 1972. p 419-421, 2 ref.

Descriptors: *Offshore platforms, *Environmental effects, *Resources development, Water resources, *Nuclear powerplants, Thermal pollution, Continental Shelf, Biota, Ecosystems, Breakwaters, Model studies, Radiation, Monitoring, Planning.
Identifiers: *Outer Continental Shelf, *Environmental impact, Artificial reefs.

The environmental considerations and the supporting program of studies for the offshore nuclear generating station is described and some of the anticipated environmental effects of the plant are discussed. A large amount of on-site investigation, laboratory experiments, and analysis is being carried out as a basis for an accurate prediction of the environmental impact. Physical models of the intake water are being tested for wave effects. An on-site ecological survey is including sampling of the marine biota on an extensive scale. A prediction of the thermal effluent release pattern is being conducted by both computer model and physical modeling. An oceanographic survey is measuring currents, temperatures, etc. Measurement of the existing natural background of radiation will be conducted. No adverse effects on the environment are predicted from studies conducted so far. (See also W76-12224) (Sinha-OEIS)

DETERMINATION OF THE CONDITIONS OF DISCHARGE OF SEWAGE INTO WATERS, (IN RUSSIAN),
Ministerstvo Zdravookhraneniya SSSR, Moscow. Institut Biofiziki.
V. M. Prusakov, and I. A. Voronova.
Gig Sant. 38(7), p 65-66, 1973.

Descriptors: *Water quality standards, Regulation, Waste disposal, *Sewage disposal, Lethal limit, *Toxicity, Water pollution control.
Identifiers: *Maximum allowable concentrations, *USSR.

The main document (USSR) on the basis of which the sanitation engineer determines the conditions of sewage discharge into waters is the Regulations for Preservation of Surface Waters. The list of maximum allowable concentrations contained should be supplemented by a list of threshold concentrations expressed in fractions of the maximum allowable concentrations. In the case of the simultaneous content of substances in sewage with the same or close concentrations, the limiting index of harmfulness for each substance is that which requires a maximum decrease of the maximum allowable concentration. The effect of summation of the threshold concentrations should be considered.--Copyright 1975, Biological Abstracts, Inc.

PROPOSED CROSS-FLORIDA BARGE CANAL: WATER-QUALITY ASPECTS, WITH A SECTION ON WASTE-ASSIMILATIVE CAPACITY,
Geological Survey, Tallahassee, Fla.
A. G. Lamonds, and M. L. Merritt.
Water-Resources Investigations No 76-23, February 1976. 189 p, 37 fig, 29 tab, 44 ref.

Descriptors: *Water pollution sources, *Canal construction, *Baseline studies, *Water quality, *Florida, Environmental effects, Surface waters, Groundwater, Aquifers, Seepage, Water table, Data collections, Evaluation.
Identifiers: *Cross-Florida barge canal.

This route of the partly completed Cross-Florida Barge Canal follows the St. Johns, Oklawaha and Withlacoochee Rivers. If the canal is completed, the Summit Reach, connecting the Oklawaha and Withlacoochee Rivers will be excavated into the Floridan aquifer. Large springs that discharge from this limestone and dolomite aquifer flow to the Oklawaha and Withlacoochee Rivers. These streams and the aquifers in much of the area contain a calcium bicarbonate water which has an average dissolved solids concentration of less than 300 mg/liter and generally is suitable for most uses. Dense groths of aquatic plants in Lake Ocklawaha and Lake Rousseau, existing impoundments for the Barge Canal, have caused large diel variations and stratification of dissolved oxygen. Problems of canal construction on the quality of water include increased turbidity and suspended sediment concentrations during dredging and land clearing operations. The impoundment of Eureka Pool in the Oklawaha River will probably result in increased aquatic plant production and large variations in dissolved oxygen concentrations similar to those in Lake Ocklawaha. In some parts of the canal, canal water will move into the aquifer, so the quality of ground water in those places will depend partly upon the quality of water in the canal. Seepage from the canal to the aquifer is expected to be larger in the Summit Reach than in any other reach. (Woodard-USGS)

A NEW STANDARD 'DRINKING WATER' (GOST 2874-73) AND ITS SCIENTIFIC BASIS, (IN RUSSIAN),
Moskovskii Gosudarstvennyi Meditsinskii Institut (I) (USSR).
S. N. Cherkinskii.
Gig Sanit. 6, p 7-11, 1974.

Descriptors: *Potable water, *Water quality standards, *Bacteria, *Coliforms, Organoleptic properties, Nitrates, Ions, Chlorides, Phosphates, Iron, Sulfates, Manganese, Aluminum, Arsenic, Lead, Toxicity.
Identifiers: Acrylamide, Beryllium, Fluorine, Molybdenum, Selenium, Silver, Strontium, *USSR.

The composition and properties of drinking water must meet certain standards concerning the degree of total bacterial contamination and content of coliform bacteria, harmlessness of the chemical composition and its favorable organoleptic properties. The previous standard specified permissible levels of only 3 toxic substances found in natural water (As 0.05 mg/l, Pb 0.1 mg/l and F 1.5 mg/l). Five additional substances are specified in the new standard (Be 0.0002 mg/l, Mo 0.5 mg/l, Se 0.001 mg/l, Sr 2 mg/l and nitrates (with respect to N) 10.0 mg/l), and flocculant polyacrylamide (2 mg/l) and Ag ions (0.05 mg/l) are specified for the 1st time. The new standard also specifies dry residue content of not more than 1000 mg/l, chlorides 300 mg/l, sulfates 500 mg/l, Fe 0.3 mg/l, Mn 0.1 mg/l, residual Al 0.5 mg/l and polyphosphates 3.5 mg/l.--Copyright 1975, Biological Abstracts, Inc.

PHOSPHORUS DEFICIENCY IN CATTLE FROM THE BRASILIA REGION OF BRAZIL, (IN PORTUGESE),
Departamento de Pesquisas e Exp., Brasilia (Brazil).
M. D. S. Dayrell, J. Doebereiner, and C. H. Tokarnia.

Pesqui Agro Pecu Bras Ser Vet. 8(6), p 105-114, 1973.

Descriptors: *Phosphorus, *Cattle, South America, *Grasses, Water pollution control.
Identifiers: Aristida-Sp, Brasilia, *Brazil, Hyparrhenia-Rufa, Melinis-Minutiflora.

Young male cattle were studied under range conditions in 4 'cerrado' areas of Brazilia (Sobradinho, Planaltina, Formosa and Luziania) for a period of 14-21 mo. Serum Pi values were determined at monthly intervals during this period. At the same time analyses of P in grass samples of Melinis minutiflora, Hyparhenia rufa and Aristida sp., were carried out, as well as soil analyses. The results of the serum Pi estimations from cattle in the areas of Sobradinho and Planaltina were in agreement with the herd histories, which indicated that the Sobradinho area was not deficient in P and that the Planaltina area was deficient in P. In the areas of Formosa and Luziania, the serum Pi levels were intermediate, and also in agreement with the herd histories, which indicate a moderate P deficiency. There was a significant correlation between the P values in the blood serum and the value of the 3 grass species with the exception of the area where there was the most severe P deficiency. There was a correlation between the P values of the soil and the yearly average serum Pi value of the cattle from all 4 areas. No correlation was found between rainfall and Pi levels in the blood serum in P deficient areas, but in the area where there is no P deficiency there was a close correlation between increased rainfall and increased Pi in the blood serum.--Copyright 1975, Biological Abstracts, Inc.

ROLE OF AGRICULTURE IN THE QUALITY OF THE NEW HAMPSHIRE ENVIRONMENT,
New Hampshire Univ., Durham. Inst. of Natural and Environmental Resources.
R. D. Harter.
Presented at Conference on Agricultural and Processing Wastes in the Eastern Region: A Perspective, Philadelphia, Pennsylvania, December 1-3, 1970, p. 78-83. 2 tab.

Descriptors: *Farm wastes, Oxidation lagoons, Waste treatment, *Agriculture, *Environment, *New Hampshire, *Cattle, *Waste disposal, Lagoons, Swine, Poultry, Water pollution control, Odor.

The majority of New Hampshire's land area is too hilly to support an economically viable agricultural operation. A large portion of the remaining area is too wet to farm. Fruit and vegetable farming has been of minor importance. But the steady increase in tourism is encouraging roadside vegetable stands. New Hampshire has a minor animal industry when compared to many states. Sheep are largely confined to the hillier less populated regions of the state. Hog production is scattered across the state, a few hogs to a farm. Poultry production is nearer populated areas and is often accompanied by odor problems. Cattle contribute appreciably to the agricultural waste problem. Waste produced by cattle is roughly equivalent to that produced by the entire human population of the state. Mass waste disposal systems are uneconomical because few dairy herds exceed 100 head, and the majority are less than 30 head. Although oxidation ponds are more acceptable than lagoons, the structure still has generally not been acceptable as a waste disposal method. The New Hampshire Cooperative Extension Service personnel are meeting with farmers and are educating them to the role they must undertake. This service has been the most important single factor in the control of pollution from agricultural sources. (Cameron-East Central)

EVALUATING A LOW-ENERGY, HIGH-VOLUME PUMP FOR ODOR REDUCTION FROM LIVESTOCK WASTE LAGOONS BY MIXING,
Oklahoma State University, Stillwater. Dept. of Agricultural Engineering.
C. E. Rice.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-257 777, $3.50 in paper copy, $3.00 in microfiche. Completion Report, (1976). 19 p, 7 fig, 1 tab, 2 ref. OWRR A-051-OKLA(1).

Descriptors: Lagoons, Odor, *Mixing, Gases, Reservoirs, Waste water treatment, Biochemical oxygen demand, *Farm wastes, Pumps, Livestock, Conductivity, Chemical oxygen demand, *Farm lagoons, Oxidation lagoons.
Identifiers: *Anaerobic lagoons, *Propeller pumps, *Odor reduction.

A low-energy, high-volume propeller pump was placed in a lagoon receiving manure material from a confined housing with pit collection swine production operation to evaluate its effectiveness in the reduction of offensive odors from the lagoon. The retention time in the pits was 26 days or greater. Another lagoon of the same size (0.405 hectare surface area by 2.2 m deep), subject to similar conditions, was close by and provided a comparison of a treated (lagoon with pump) system with an untreated (lagoon without pump) system. The lagoons were anaerobic, very turbid and had no dissolved oxygen. The pump could completely mix the lagoon liquid about every four hours and it was operated from July 17, 1975 through Jauary 6, 1976. COD, BOD5, DO, pH, temperature, conductivity and general observations were obtained on a weekly basis beginning two weeks before start-up of the pump and through May, 1976. The observed results for the treated and untreated systems followed the same pattern. This indicated that the pump was not having a significant effect on the lagoon. The major difference observed was that the boiling activity, caused by the release of accumulated gases from the lagoon to the atmosphere, of the treated lagoon was reduced significantly compared to the untreated lagoon.

LOW-COST DISPOSAL SYSTEMS FOR FEEDLOT RUNOFF,
Agricultural Research Service, Lincoln, Nebr.
N. P. Swanson, and C. L. Linderman.
Agricultural Engineering, Vol. 55, No. 11, p 20-21, November, 1974. 3 fig.

Descriptors: *Agricultural runoff, *Feed lots, Disposal, *Costs, Irrigation, *Waste disposal, *Farm wastes, Sprinkler irrigation, Percolation, Waste treatment.

Cattle feeders are required by law to control runoff from their feedlots. The most practical method for disposing of runoff is land disposal through irrigation. The feeder needs a low-cost disposal system that is fitted to a minimum land area. The Soil Conservation Service recommends a disposal area 1 1/2 to 2 times larger than the contributing feedlot, but the specific area needed for disposal to empty the holding pond at any one time should be no longer than the feedlot. The runoff may be disposed of by a gravity flow system or through sprinkler irrigation. Gravity disposal through gated pipe, hoses, or single point discharge may require land preparation, some form of pump, protection from freezing, and it may require more labor. Sprinkler distribution requires more power, may require a reuse pit due to the runoff caused by the distribution, and may cause excess wetting during the seedling stage or just before harvest, thus damaging crops. Care must be taken in selecting irrigation components and in scheduling field applications. The larger the system, the more consideration should be given to application and distribution efficiencies. The most important considerations for smaller systems are low investment and labor costs. With either type, care must be taken to avoid ponding and mosq breeding. Also the area should be located to advantage of prevailing winds to avoid odor b up near residences. (Merryman-East Central)

LITTLE POLLUTION FROM THIS FEEDLO
Agricultural Research, Vol. 19, No. 6, p 1
December, 1970. 2 fig

Descriptors: *Feed lots, *Nebraska, Anal Nitrates, Gases, Nitrification, Climates, * wastes, Water pollution control.
Identifiers: Manure pack.

The results of an investigation concerning ni pollution of a shallow groundwater table, ducted on a flat cattle feedlot in Nebraska discussed. The 120-by-305 ft. lot was chose study because of such conditions as: stocking of 400 sq. ft. per animal; little manure rem highly permeable soil; fluctuating high-w table; and little surface drainage. Observation measurements indicated that the manure (nearly 1 ft. thick) and the soil and manure fo common interface that effectively bars movement. Analysis of soil core samples sh that downward movement of nitrates and forms of nitrogen in the soil is minor. Prom by interface of aerobic conditions in the pac anaerobic conditions below the interface lea generation of nitrates by nitrification in the bic zone, while breakdown by denitrificatio curs in the anaerobic zone. Biological activi the two zones creates gaseous compounds su ammonia, carbon dioxide, and amines, whic dispersed into the atmosphere. Seven wells installed in and around the lot to obtain water ples and water table depth measurements. samples were taken periodically from wells n the feedlot and analyzed. The estimates indi that 20 to 40 percent of Nebraska cattle fe operations are on flat, permeable soil. The surements indicated that considerable amou solid wastes can be removed simply by de position on the lot. These field observation supported by results of laboratory studies. Central)

MAINE GUIDELINES FOR MANURE AND MANURE SLUDGE DISPOSAL ON LAND.
Maine Univ., Orono. Cooperative Extension Service.
Miscellaneous Report 142, The Life Sciences and Agricultural Experiment Station and the Cooperative Extension Service, University of Maine, Orono, 1972, 21 p. 2 fig, 11 tab.

Descriptors: *Sludge disposal, *Maine, Nitrogen, Lagoons, Irrigation, Landfills, *Farm wastes, Waste disposal, *Water quality standards, Recycling, Dehydration.
Identifiers: *Land spreading, Composting.

This standard is concerned with conditions for: (1) total recycling of nutrients through planned crop production; (2) disposing of excess manure on the land by spreading; (3) piling on the land; (4) bulk burying in landfill; (5) composting; (6) lagoon treatment with sludge and liquid disposal; (7) disposal by irrigation; and (8) dehydrated manure disposal. Maximum rates for spreading manure on land and for other methods were developed from the physical and chemical characteristics of each individual soil, and from the available knowledge of the movement of manure liquids and residues on and through each soil type. The limiting factor in determining application rate is the pounds of nitrogen per acre to be applied. An extensive table is given summarizing the permissible disposal practices and maximum manure application rates for several Maine soils. (East Central)

RELATING AGRICULTURAL INSTRUCTION TO ENVIRONMENT IMPROVEMENT: THE ROLE OF LAND AND SOIL,
Arizona Univ., Tucson. Dept. of Agricultural Chemistry and Soils.
V. H. Fuller.
Journal Paper No. 1854, Arizona Agricultural Experiment Station, University of Arizona, 1971, p. 9-72. 4 fig, 1 ref.

Descriptors: *Soils, *Waste disposal, *Oceans, Water pollution, *Soil contamination, Fertilizers, Soil conservation, Organic matter, Carbon dioxide, Bacteria, Nutrients, Municipal wastes, Nitrogen, Phosphorus, Sulfur, *Farm wastes, Education, *Training.
Identifiers: *Agricultural instruction, *Land disposal.

For many years warnings have been issued that man's waste disposal problem should be controlled before it gets out of hand. In the past these warnings were ignored, but today many people are working to slow down the pollution of the environment. Pollution usually ends up in either the soil or ocean. Resistance to polluting the ocean has thrown most of the burden of waste disposal on the soil. Pollution can be controlled through the soil because it is an excellent digester of wastes. The soil decomposes organic matter. It produces nitrogen and sulfur through complex microbial cycles which are initiated by organic material, and the end product of most waste is carbon dioxide, water, and humus. What is needed is knowledge of how to use these wastes to benefit the soil, and this should begin in the colleges. Courses should be developed to make people aware of the problems and the solutions. ECONOMIC EVALUATION OF LIQUID MANURE DISPOSAL SYSTEMS FOR DAIRY CATTLE,
Economic Research Service, Madison, Wis. Farm Production Economics Div.
D. D. Kimball, L. V. Lenschow, and R. E. Rieck.
Bulletin R2199, College of Agricultural and Life Science, University of Wisconsin, Madison, August, 1970, 24 p. 8 fig, 5 tab.

Descriptors: *Liquid wastes, *Waste disposal systems, *Economics, *Costs, *Dairy industry, Waste storage, Equipment, Facilities, Labor, *Wisconsin, Water pollution control, *Farm wastes, Waste treatment.

Experiences are described of Wisconsin dairy farmers who installed liquid manure disposal systems. These liquid manure systems include: (1) free-stall, all liquid (2) free-stall, liquid-conventional, (3) stanchion, all-liquid, (4) stanchion liquid-conventional. Comparisons are made of liquid manure storage, facility, investments, annual costs, and costs and returns analysis. The most economical manure-handling system depends on many variables. The net disposal costs depend upon both the value of the manure and the cost of disposing the excrement. By changing the amount on nitrogen, phosphorus, and potassium recovered and making different assumptions regarding operating and ownership costs, the optimum system of manure disposal would change. In addition, installation costs are only the out-of-pocket costs--farmers did not report a charge for their own labor. Therefore, each farmer must ask himself whether the assumptions used in this study agree with his particular situation and then interpret the results accordingly. (Merryman-East Central)

BEEF FEEDLOTS - A POLLUTION PROBLEM,
Agricultural Research Service, Lincoln, Neb.
C. B. Gilbertson.
Proceedings of Agriculture and Pollution Seminar, University of Arizona, Tucson, February 19, 1971, EES Series Report No. 35, p. 18-29. 5 tab, 19 ref.

Descriptors: *Feed lots, *Management, *Water pollution sources, *Air pollution, *Waste disposal, Climates, Agricultural runoff, Chemical properties, *Farm wastes, Livestock, Water pollution control, Pollution abatement.

The waste produced by the livestock feeding industry creates a pollution problem for management. The management of feedlot is affected by physical characteristics of the feedlot, climatic conditions, animal size, animal density and the type of ration fed. Livestock wastes are potential pollutants of (1) surface water, (2) ground water, (3) air, and (4) aesthetic values. Each of these problems is discussed. The primary problem in feedlot management is the need for acceptable pollution-free waste management schemes to replace waste disposal systems. An acceptance of an available method rather than research-backed recommendations is the reason for existing waste management practices. (Kehl-East Central)

GUIDELINES FOR HANDLING LIQUID WASTE FROM FEEDLOTS,
Texas Water Quality Board, Austin.
D. L. Pittman.
In: Soil Conservation Service, Texas Tech University Workshop Committee on Feedlot Waste, Texas Tech University, Lubbock, July 28-29, 1971, 4 p.

Descriptors: *Feed lots, *Liquid wastes, *Agricultural runoff, *Waste water disposal, *Water quality standards, Waste treatment, *Farm wastes.
Identifiers: *Solid waste disposal, Waste Control Order for Cattle Feeding Operations, Holding ponds.

The procedure for obtaining a Waste Control Order for Cattle Feeding Operations from the Texas Water Quality Board is given. Application evaluation is primarily based on pollution control measures for the following: (1) collection and retention of feeding area runoff water, (2) disposal of accumulated waste water, (3) groundwater protection from holding pond waste water seepage, and (4) disposal of accumulated solid waste. The process of obtaining a waste control order generally takes 3 months or longer. (See also W76-12363) (Kehl-East Central)

AN IN-SITU INVESTIGATION OF OIL BARRIER SHAPE AND DRAG COEFFICIENTS,
Rhode Island Univ., Kingston. Dept. of Ocean Engineering.
R. M. Larrabee, and G. A. Brown.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A017 099, $7.25 in paper copy, $3.00 in microfiche. U.S. Coast Guard Final Report No. USCG-D-161-75, July 1974. 201 p, 80 fig, 21 tab, 28 ref, 5 append. DOT-CG-33,962-A.

Descriptors: *Continental Shelf, *Oil pollution, *Oil spills, Resources development, *Water quality control, *Pollution abatement, *Barriers, Drag, Ocean currents, Waves(Water), *Rhode Island, Bays.
Identifiers: Outer Continental Shelf, Offshore technology, Wave action, Current action, *Oil barriers, *Narragansett Bay(RI).

In-situ experimentation on a moored 100 foot section of commercially procured oil barrier was carred out in the vicinity of the Jamestown Bridge in the West Passage of Narragansett Bay. The objectives were to study oil barrier shape and tensions as influenced by current and wave action, to analyze data on the barrier shape with existing analyses and to compare results of tension and drag coefficient data with previous investigations. Actual barrier shape was compared to a theoretical catenary drawn through the barrier end points. The shape, load, current and wave data were used to calculate various drag coefficients for the boom. Two techniques were used to calculate drag coefficients for the barrier and results of each were compared. The effects of wave action on barrier loading were determined by the analysis of two previous investigators and the results compared. Values of drag coefficient were reduced to a basic drag coefficient, independent of barrier shape configuration as well as wave effects. Results of the investigation showed that the catenary curve is a good approximation to barrier shape. The values of drag coefficients calculated indicate that a value of 1.5 to be a good approximation for the calm-water basic drag coefficient for the moored oil barrier. (Sinha-OEIS)

HIGH SEAS OIL CONTAINMENT BARRIER MOORING SYSTEM,
Coast Guard Research and Development Center, Groton, Conn.
K. R. Bitting.
Available from the National Technical Information Service, Springfield VA 22161 as ADA 020 980, $5.00 in paper copy, $3.00 in microfiche. Final Report No. USCG-D-176-75, July 1975. 86 p, 14 fig, 3 tab, 4 append.

Descriptors: *Continental Shelf, *Oil pollution, *Oil spills, *Pollution abatement, Water quality control, *Barriers, Water resources, Resources development.
Identifiers: *Outer Continental Shelf, *Mooring systems, *Oil containment.

The mooring system was designed, fabricated and tested to moor the Air Deployable Lightweight High Seas Oil Containment Barrier, a component of the U. S. Coast Guard's High Seas Oil Spill Response System. The key criteria to which the mooring system was buit are: (1) deliverable by HH-3 helicopter, (2) holding capacity of 8,500 pounds with 1,000 pound nominal load, (3) capability of obtaining a mooring scope of 2:1 to 3:1 in water depths of 25 to 200 feet. The system consists of an inflatably buoy, 500-pound STATO anchor, 550 feet of 7/8 diameter polyurethane-jacketed nylon line and 45 feet of 3/4 inch chain, and a delivery container. Once the mooring system has been delivered to the site by the helicopter, a small boat tows it to the location and activates the system. The delivery container is recovered by a buoy tender once the system has been deployed. Computer methods were used to size the anchor and mooring line segments that are used to construct a mooring of desired length and scope. Anchor holding power and operational sequence tests were conducted. The system weighs 2,350 pounds and has a delivery radius of 70 nautical miles as external cargo under an HH-3 helicopter. FAST CURRENT OIL RESPONSE SYSTEMS, TESTS ON PHASE I CONCEPTS,
Michigan Univ., Ann Arbor. Dept. of Naval Architecture and Marine Engineering.
W. P. Graebel, and V. A. Phelps.
Available from the National Technical Information Service, Springfield, VA 22161 as ADA 022 928, $9.75 in paper copy, $3.00 in microfiche. U. S. Coast Guard Final Report No. USCG-D-20-76, April 1975. 305 p, 219 fig, 7 tab, 5 append. DOT-CG-32430-A.

Descriptors: *Instrumentation, *Oil pollution, Water quality control, *Separation techniques, *Pollution abatement, *Data processing, Testing, Test facilities, *Water pollution control, Equipment.
Identifiers: Fast current oil response systems, *Oil recovery.

Seven different concepts for fast current oil response systems were tested at the University of Michigan Fast Current Recirculating Channel. The purpose of the tests was to perform an equivalent series of tests on each device under the same environment to enable competitive comparison of the devices. This evaluation was made both quantitatively through instrumentation, and qualitatively by observation of the tests. Testing was done by University of Michigan staff with a U. S. Coast Guard officer in attendance. The device was operated by the contractor. The test program matrix included three oil viscosities, four nominal slick thicknesses, and seven current speeds. A maximum of fifty-one tests were scheduled for each device, depending on device size and capacity. The seven concepts are ranked in the order of best performance. None of the seven devices tested are near to meeting the stated goals of the Coast Guard, although they do improve present current speed capabilities by a factor of three when compared to barriers. Available from the National Technical Inform tion Service, Springfield, Va 22161 as AD-A0 945, $4.50 in paper copy, $3.00 in microfiche. U. Coast Guard Final Report No. USCG-D-175- August 1975. 67 p, 10 fig, 1 tab, 23 ref. DOT-C 52,312-A.

Descriptors: *Oil pollution, Water resourc Water quality control, Pollution abatement, C water, *Membranes, Coasts, Transportati Elastomers, Continental Shelf, Water pollut control, Waste water treatment.
Identifiers: Ballast tanks.

The research and engineering development eff on the membrane oil pollution prevention syst (MOPPS) conducted for U. S. Coast Guard and S. Navy is reviewed and evaluated. Scale mo tanks were used to define and evaluate proble associated with dynamic response of membr configurations under simulated operating co tions. A commercially available neoprene-ny nitrile elastomer was found to be the best mate for the membrane. Evaluation of the physical p perties of a full scale thickness material indica that the elastomer can withstand abrasion, oil mersion, creasing, wrinkling and pressure fluc tions. Preliminary results indicate little susce bility to biodeterioration. However it is belie that further study on MOPPS is not warrante the present time because of costs, operati complexity, and apparent industry acceptanc segregated clean ballast systems. (Sinha-OEIS)

PHOSPHORESCENCE FILTER FOR OIL-WATER DISPERSIONS,
Phillips Petroleum Co., Bartlesville, Okla. (Assignee).
R. Bresson.
U.S. Patent No. 3,960,719, 3 p, 1 fig, 1 tab, 6 ref; Official Gazette of the United States Patent Office, Vol 947, No 1, p 306, June 1, 1976.

Descriptors: *Patents, *Oil pollution, *Oily water, Water pollution treatment, *Water quality control, Separation, *Coalescence, Polymers, *Separation techniques, *Dispersion, *Filters.
Identifiers: Ballast water.

A filtering media is provided for the removal of oil dispersed in a water phase such as ballast water in water tankers and bilge water from oil fired ships. A fabric made of an oleophilic, fiber-forming polymer having a high ratio of surface area to unit weight is used as the filtering medium through which is passed a mixture of oil droplets dispersed in a water phase thereby agglomerating the oil into sufficiently large drops that they will separate from the water phase to form a separate oil phase. Although a nonwoven fabric comprising a needled bat of carded fibers forms a basis for the experimental data, any method of producing a coherent fabric, such as weaving, should be suitable for the invention as long as the fabric produced has a high ratio of surface area to unit weight. The fabric will be used in multiple thicknesses in constructing a filter element. In a preferred embodiment a nonwoven fabric comprising a needled bat of carded polypropylene fibers fused on one side only and capcoated with an additional layer of polypropylene fibers needle punched into the unfused side was tested as a coalescing agent suitable for the invention. (Sinha-OEIS)

OIL ADSORBENT,
Idemitsu Kosan Kabushiki Kaisha (Japan). (Assignee).
M. Tomikawa, A. Tsunoda, K. Kaneda, H. Ohkawa, and Y. Mugino.
U.S. Patent No. 3,960,722, 4 p, 2 fig, 5 ref; Official Gazette of the United States Patent Office, Vol 947, No 1, p 307, June 1, 1976.

Descriptors: *Patents, *Oil pollution, *Oily water, *Water pollution treatment, *Water quality control, *Adsorption, Industrial wastes, Oil spills, Plastics.

An oil adsorbent is provided which is capable of effectively removing oil in water, has negligible water adsorbability and is easily disposable by incineration. A resin of polyethylene series is heated at a temperature near the softening point of the resin. An inorganic calcium compound is then added to the softened resin and the mixture is homogeneously mixed and the temperature is gradually elevated. The mixing operation is finished when the temperature of the mixture has reached 130-170C. The resultant milled mixture is then cooled, solidified and crushed to a solid granular material which is then charged into a conventional foam shaping extruder where the material is heated to a melt. The melt is extruded to form a foamy substance. The foamy substance in the form of a rope is shaped into a net by knitting or weaving or by adhesion. When the network product thus shaped is used as oil adsorbent, oils are not only adsorbed to the product but also kept in the interstices. (Sinha-OEIS)

THE EFFECT OF METHODS OF OPERATION OF AERATION BASINS ON THE DEVELOPMENT AND POPULATION DENSITY OF CULEX PIPIENS L. IN THE SOUTH OF THE RUSSIAN SFSR, (IN RUSSIAN),
Rostov Research Inst. of Medical Parasitology (USSR).
L. Y. Il'chenko.
Med Parazitol Parazit Bolezn. 43(3), p 335-341, 1974.

Descriptors: Aeration, *Sewage lagoons, *Oxidation lagoons, *Mosquitoes, Insect control, *Aerated lagoons, *Insect control, Operations, Sewage treatment.
Identifiers: *Culex-pipiens, Russian-SFSR, USSR.

In the suburbs of Novocherkassk (USSR), sewage treatment basins are mass breeding places of C. pipiens. Improper operation leads to overloading with sewage and creates favorable conditions for mass breeding of these mosquitoes. Development of the water stages of C. pipiens depended mainly on the operating regimen of these aeration basins. Certain regimens completely prevent emergence of mosquitoes and permit control of C. pipiens by sanitary-hydrotechnical measures without insecticides.--Copyright 1975, Biological Abstracts, Inc.

COST OF WATER POLLUTION CONTROL IN THE CARPET INDUSTRY,
Exxon Research and Engineering Co., Florham Park, N.J. Water Pollution Control Section.
B. Black, L. D. James, and E. C. Tincher.
American Dyestuff Reporter, Vol 65, No 6, p 16, 18-19, 22, 61-62, June, 1976. 5 tab, 13 ref.

Descriptors: *Textiles, *Water pollution control, *Economic impact, *Legal aspects, Legislation, Costs, Federal Water Pollution Control Act, Industrial wastes, Waste water treatment, *Water quality standards.
Identifiers: Textile industry, Carpet and rug industry.

The economic impact of effluent guidelines required by the Federal Water Pollution Control Act of 1972 on the carpet and rug industry is examined. Under the Act, carpet mills that discharge pollutants directly to the environment must install the best practicable control technology currently available by 1977 and the best technology economically achievable by 1983. The typical investment for water pollution control equipment by 1983 is expected to be between $500,000 and $1 million for a mill. The cost of producing a square yard of carpet may increase by about 2.4 cents by 1977 and by 5 cents by 1983. These increases seem too small to affect sales on the basis of available data. Ground Water, Vol. 14, No. 4, p 194-199, July-August 1976. 7 fig, 7 ref.

Descriptors: *Surface-groundwater relationships, *Wisconsin, Central U.S., *Glacial aquifers, *Subsurface flow, * Lakes, *Tracking techniques, *Eutrophication, Groundwater, Groundwater movement, Percolation, Sediments, Seepage, Lake beds, Seasonal, Limnology, Flow system, Lake stages, Unsteady flow.
Identifiers: *Lake flushing rates, *Lake rejuvenation, Northern Wisconsin, *Snake Lake(Wis), Seasonal water level fluctuations, Tracer studies.

Lake rejuvenation efforts in the Upper Midwest are important to the area's economic dependence on high-quality lakes for tourism. In developing eutrophication studies for lakes in this area, it is essential to determine the thickness of aquifer communicating with the lake, as a preliminary to calculation of the lake flushing rate. The thickness of communicating aquifer is particularly critical for lakes fed primarily by ground-water recharge, e.g., Snake Lake, Wisconsin. Through use of observation wells and chloride tracer analysis, effective aquifer thickness at Snake Lake was determined to be 30 to 50 feet. However, the local flow systems were additionally found to be highly variable through the progression of seasions. It was recommended that the possible effect of such dynamic seasonal fluctuations on the local flow

systems being considered in eutrophication studies to avoid possible improper siting of underground chemical and/or petroleum storage facilities and septic tanks in glacial deposit environments. (Prickett ISWS)

POLLUTION CONTROLS -- CONSULTANT'S ROLE,
Mason (H. C.) and Associates, Inc., Gladstone, Oreg.
H. Edel.
In: Proceedings on Wood Residue as an Energy Source, September 3-5, 1975, Denver, Colorado, Forest Products Research Society, Madison, Wisconsin, p 114-115.

Descriptors: *Pollution abatement, Water pollution control, Air pollution, Solid wastes, Legislation, Profit, Economic impact, Safety, Wastes, Industrial wastes, Water pollution sources.
Identifiers: *Forest products industry, Noise pollution.

An increasing number of pollution control problems, such as boiler emissions, water pollution, solid wastes, noise levels, etc., from forest industry production facilities are being dealt with by consulting firms. All of these control problems have had major consequences to the forest products industry since the enactment of many federal, state, and regional pollution and safety regulations. Economic consequences of meeting strict pollution regulations were given little thought initially by legislators. The pollution control problems that require help from a consultant, however, are usually the more subtle aspects for meeting the detailed requirements of particular regulations. The primary role of a consultant is to increase productivity and profits while meeting established pollution regulations. (Witt-IPC)

Identifiers: *Data bases, Query language.

The development of a computer-based information system for a state Stream Pollution Control Board is examined. It is concerned with the application of the Generalized Planning System (GPLAN) to a large scale water pollution problem. This planning system, which includes both a database and a collection of application programs, has been passing through a series of modifications and extensions to make it more adaptive to its environment. Although much theoretical work has gone into the GPLAN system design, the key to its acceptance will indeed be determined by those changes, as discussed in this paper, which have been a direct result of actual implementation and use in a real life situation. WATER QUALITY LAW IN FEDERAL REPUBLIC OF GERMANY,
Bonn Univ. (West Germany). Inst. fuer das Recht der Wasserwirtschft.
K. Seifert, and T. C. Lyons.
Journal of the Water Resources Planning and Management Division, Proceedings of the American Society of Civil Engineers, Vol. 102, No. WR1, p 23-33, April 1976. 1 fig, 1 tab, 10 ref.

Descriptors: Water resources, *Water law, *Water quality, *Legislation, Water pollution, Europe, *Water pollution control, Water rights, History.
Identifiers: *West Germany.

The Federal Republic of Germany (FRG) is one of the most industrialized countries in the world today with a Gross National Product exceeded only by two other nations (USA and Japan). This industrial base, as well as a population of 62,000,000, is crowded into an area of 248,000 sq km, which is about the size of the State of Oregon. Attendant with this intensive development have been the same water quality problems that plague all heavily industrialized nations. Like other countries with these environmental problems, the FRG has developed a body of laws and administrative procedures that are intended to expedite the nation's effort in environmental enhancement. This paper traces the historical development of legislation and administrative procedures in water quality law and their practicability. The paper concludes with proposals on both changes in the laws and in the methods with which water quality legislation could be implemented and administered in the FRG. (Bell-Cornell)

Descriptors: *Water quality, *Mathematical models, *Management, *Operations research, Water resources, Computers, Hydrodynamics, Equations, Rivers.
Identifiers: *Formation processes.

At present, water quality formation processes may be mathematically modeled in various ways. The choice of model depends on the volume of the required information, as well as upon the volum of the available initial information and on t required precision of the information obtaine Employment of any modern mathematical mod demands the application of computers and the limitations and may also influence the choice of applicable model. Herein, a river with a system water-protecting construction is investigated, co siderable involvement and space distribution a the usual characteristics, as well as a large numb of natural and man-made factors influencing t processes of the river water quality formation multitude of uncontrollable disturbances, t limited possibilities of operative effects, and large number of interacting regulators. Consider are two principally different approaches to mo construction: the analytical and the synthetic. I operative control in complex systems of wa resources it is possible to apply mathemati models constructed on the basis of both metho A model for each specific case should be cho according to the peculiarities of the subject, required information, and the computer capaci (See also W76-12535) (Bell-Cornell)

In: The Use of Computer Techniques and A mation for Water Resources Systems, Wash ton, D.C., April, 1974, Vol. II, p 88-91.

Descriptors: *Environmental engineering, *W pollution control, *Storm water, *Managem *Mathematical models, Urban runoff, Simula analysis, Computers, Systems analysis.
Identifiers: *Storm Water Management Model.

Recent investigations have revealed that st water discharges and combined sewer overfl are major sources of urban water pollution. obvious that construction of separate storm sanitary sewers is not the solution, and it is equ infeasible to construct treatment plants capabl treating the peak flows generated in a comb system. The development of the digital comp has made complex mathematical models wi available to the engineer, and such an approa ideally suited to the examination of storm combined sewer overflow pollution abatemen ternatives. The EPA's Storm Water Manage Model (SWMM) is a comprehensive mode urban hydrological phenomena. It uses the rai and system characteristics as inputs, determ quantity and quality of runoff, routes this ru through a combined sewer system with spec storage and treatment facilities and operating cies and thence into receiving waters, where impacts are identified. This article describes model, lists its applications, and discusses ne modifications for its future development and plication to assist in the design of pollution co facilities. NOTHER VIEW OF OFFSHORE OIL AND AS OPERATIONS.
arine Technology Society Journal Vol 8, No 9, p 2, October/November 1974. 34 ref.

escriptors: *Environmental effects, *Resources velopment, *Water quality control, Water ources, Continental Shelf, Oil, Gases, Assess-nt, Leases, Ecology, Drilling.
ntifiers: *Outer Continental Shelf, *Offshore hnology, *Environmental impact, *Offshore ling.

e report 'OCS Oil and Gas - an Environmental sessment,' was examined by a committee of the tional Academy of Sciences. Excerpts from the mittee's findings about the CEQ report and issues, both technical and of public policy are sented. While the Council on Environmental ality (CEQ) Report is a responsive advisory ement on future environmental policies regard-OCS oil and gas, the committee wishes to ss the study's limited mandate as well as its un-standable avoidance of consideration of alter-ves to our current national energy policy. The ort accepts OCS development as an exclusive vity of the private sector without examining ous legislative proposals for a federal oil elopment corporation or for other public elopment entities such as exist in other coun- that produce oil and gas. Finally, the report s on the precept that continued annual growth ergy availability to the year 2000 and beyond cepted public policy. The committee believes these assumptions should be challenged by all erned with the development of a viable, long- national energy policy. The committee mmends that a vigorous effort be initiated to nd knowledge of the physical and biological ronments and the ecological systems likely to ffected. Ecological studies of an area that t be affected by OCS development should be ucted while plans are developing for explora-and engineering, so that the possible effects e evaluated before significant impacts occur. a - OEIS)

APPROACH TO THE SUPER-T/REFINERY QUESTION,
s Coastal and Marine Council, Galveston.
Moseley, and J. Frucht.
ne Technology Society Journal, Vol 8, No 8, September 1974.

riptors: *Continental Shelf, *Resources opment, *Oil industry, Water resources, *Oil ion, *Water quality control, *Environments, ts, Management, Planning, Ports, Coasts, England, New Hampshire.
fiers: *Outer Continental Shelf, rports, Refineries, Deepwater ports, En-nental impact.

f discussion is presented on the controver-sues on the construction of deepwater ports ports) and the required oil refineries. It was ted before a New England conference on ubject held at the University of New Hampshire. The authors make the following suggestions: Realize that a large deepwater port and/or refinery complex is a permanent irreversible commitment; Learn something about the oil business--something other than Exxon ads and Common Cause press releases; Realize the difference between evolutionary and revolutionary actions/impacts in the context of DWPs and refineries; Realize that even in Texas, the oil and chemical industry doesn't own all politicians; Realize that credibility is usually proportional to size; Realize the magniture of the stakes involved; Consider a DWP/refinery and Outer Continental Shelf oil and gas development as related issues; Do not believe the promises and/or threats of promoters and hysteria peddlers; Do not act hastily nor finally with either closed or open arms; Do not naively believe that things can be completely controlled once development starts, and Do not become confused by lawyers (or engineers, or planners, or ecologists, or etc.) debating the finer points of facility siting/regulatory legislation and lose sight of the major public policy issues. On the issue of deepwater ports and refineries the private citizen's responsibilities include: seeing that all the appropriate issues are raised and revealing questions asked, pressing elected/appointed officials to thoroughly pursue the matter, and insisting on full and accurate disclosure by all included parties. DEVELOPMENT OF RESIDUALS MANAGEMENT STRATEGIES,
Indiana Univ., Bloomington. School of Public and Environmental Affairs.
C. N. Ehler, R. S. Howe, and N. White.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-251 012, $5.00 in paper copy, $3.00 in microfiche. Environmental Protection Agency, Report EPA-600/1-76-01/B, January 1976. 82 p, 6 fig, 5 tab, 3 append. R-803313-01-1.

Descriptors: *Waste disposal, *Decision making, *Planning, *Non-structural alternatives, *Water management(Applied), Pollution abatement, Water quality, Alternative planning, Institutions, Environment.
Identifiers: *Residuals, Residuals generation and discharge model, Residuals management strategies, Implementation, Physical methods.

Based on the premise that human activity generates and discharges waste residuals, a residuals generation and discharge model is proposed to achieve governmental standards of environmental quality. The residuals management model identifies various points in the residuals generation and discharge process where intervention with physical methods can reduce or alleviate the effect of residual wastes on the environment The physical methods are supplemented by implementation measures (non-structural actions such as laws, regulations and ordinances) and institutional arrangements (public organizations which establish goals and objectives, select and enforce physical methods, and adopt implementation measures) to form a residuals management strategy. Recommendations are: (1) use residuals generation and discharge model in the planning process; (2) the planning process for reviewing alternative residuals management strategies should start without considering legal, political, technological or social constraints; (3) all reasonable alternatives should be considered by decision makers; (4) the residuals generation and discharge model could serve as a common base for consumers, labor, business and government groups concerned with planning for environmental quality. REPORT OF THE QU'APPELLE BASIN STUDY BOARD.
Saskatchewan Quappelle Basin Study Board, Regina.
October 1972. 92 p, 50 fig, 17 tab, 3 plates, 34 ref.

Descriptors: *Water quality, Water management, *Land use, Water resources, *Watershed protection, *Water supply, *Flood protection, *Canada, Algae, Planning, Agriculture, Institutions, Waste water treatment, Water use, River basins, *Saskatchewan.
Identifiers: *Qu'Appelle River Basin, Moose Jaw(Saskatchewan), Regina(Saskatchewan), Buffalo Pound Lake(Saskatchewan).

A comprehensive framework plan to develop and manage the water and related land resource of the Qu'Appelle Basin for social betterment and economic growth is presented. It was prepared by collecting basic data, determining planning objectives, analysing and evaluating alternatives, and finally, preparing the plan. The basin, which is a flat or gently undulating treeless plain, contains 20,000 square miles and is cut by the Qu'Appelle River Valley through its entire length to a depth of 100 to 300 feet. Population, currently at 280,000, will reach 320,000 by the year 2000. Continued urbanization in the basin is expected. Problems include algae blooms, flooding in urban areas, poor public access to lake shores in places, and possible water supple difficulities in the future. The plan contributes to a number of objectives: water supply and quality; industrial development public health; flood protection; recreation; wildlife; etc. Recommendations are presented in 5 categories; water quality; water supply; land and water surface use; adjustment to flood hazard; and general. Some recommendations for water quality are: specific objectives for water quality should be established; higher levels of treatment should be provided in Regina and Moose Jaw; agricultural practices in the basin should be controlled; regulations for waste disposal should be implemented; and water quality should be monitored. Recommendations with similar scope are given in the other areas. Recommendations on public participation, institutions, education, construction standards, and ownership are discussed in the general category. (Smith - North Carolina)

WATER QUALITY OBJECTIVES.
Environmental Protection Service, Regina (Saskatchewan). Water Pollution Control Branch. January 1975. 16 p, 6 tab, append.

Descriptors: *Water quality, *Water quality standards, *Pollution, Water resources, *Water management, *Saskatchewan, Surface waters, Groundwater, Algae, Municipal water, Sewage treatment.
Identifiers: *Water quality objectives, Private water supply.

This listing of specific objectives pertains mainly to surface water, but deals to a small degree with ground water resources. The management objective of this agency is to conserve and protect water resource and to maintain and improve its quality for public protection, within economic limits. This serves the following purposes: protection of water supplies; encouragement of economic development; preservation of wildlife. The guidelines and objectives ennumerated here are not meant to be rigid, but serve as guides. Each case of waste disposal and water pollution is looked at on its own merits while considering a broader water quality

management point of view. The general objectives for effluent discharges are that such discharges should be: free from toxic or potential toxic substances; free from substances that will form objectionable sludge; free from debris, oil, etc. that would be noticeable in receiving waters; free from color, turbidity, or odour-producing materials that would have certain effects; and free from nutrient that would create nuisance growths. Specific objectives are given for: surface water, algae and acquatic nuisances, municipal drinking water, ground water quality, guidelines for private water supplies, and guidelines for sewage treatment. Objectives are given both as numbers and more general statements. An appendix explains 43 separate parameters used to measure water quality. (Smith - North Carolina)

WASTEWATER RESOURCES IN NORTH CENTRAL TEXAS,
Camp, Dresser and McKee, Inc., Boston, Mass.
D. R. Horsefield, and J. D. Goff.
American Water Works Association Journal, Vol. 68, No. 7, p 357-359, July, 1976.

Descriptors: *Water reuse, *Reclamation, *Reclaimed water, *Municipal wastes, *Cooling water, *Electric power industry, Treatment facilities, Water requirements, *Texas, Symbiosis.

The feasibility and desirability of waste water reclamation in North Central Texas are discussed. A review of various water reuse alternatives for the area indicates that the steam electric power industry is a potentially large user of reclaimed waste water. Cooling water requirements for the 11 major power plants in North Central Texas amount to an estimated 56 million gallons/day based on the present utilization of cooling towers and lakes, and water requirements are expected to more than double within the next 10 years. By the year 2000, water requirements based on existing cooling technology are expected to be a major problem for the power industry. Thus, the locating of new power plants near municipal waste water facilities so that high quality effluent can be used for cooling towers is recommended. (Kreager-FIRL)

AVAILABILITY OF GROUND WATER NEAR CARMEL, HAMILTON AND MARION COUNTIES, INDIANA,
Geological Survey, Indianapolis, Ind.
D. C. Gillies.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-255 224, $4.00 in paper copy, $3.00 in microfiche. Water-Resources Investigations 76-46, May 1976. 27 p, 10 fig, 2 tab, 7 ref.

Descriptors: *Groundwater resources, *Projections, *Water supply, *Aquifer characteristics, *Hydrogeology, Data collections, Test wells, Water yield, Regression analysis, Computer models, Transmissivity, Storage coefficient, Groundwater recharge, Pumping, Seepage, Water levels, Observation wells, *Indiana.
Identifiers: Carmel area(Ind).

A study of the hydraulic characteristics of the unconsolidated glacial deposits near the city of Carmel in central Indiana shows that 21.3 million gallons per day (mgd) of additional water could be withdrawn from the aquifer for an indefinite period of time. This pumpage is approximately 5 mgd above the projected water needs of Carmel for 1990. Saturated thickness, transmissivity, and storage coefficient of the outwash aquifer along the White River east of Carmel were determined, using available data supplemented by test drilling. The saturated thickness of the aquifer ranges from 10 to 110 feet; transmissivity ranges from 1,000 to 24,000 feet squared per day; and the average storage coefficient is 0.11. Seepage from the aquifer into the White River was estimated in November 1974, using data from U.S. Geological Survey gaging stations. Water-level information was obtained from a network of observation wells at that same time. A digital-computer model was used to estimate the rate of withdrawal that might be sustained from the aquifer and the effect of that withdrawal. The predicted average reduction of the flow of the White River is 21.3 mgd in the study area. To develop the fullest potential of the aquifer and to maintain reasonable pumping rates, pumping wells should be located as near to the river as possible and where the aquifer saturated thickness equals or exceeds 50 feet. ers: Cost minimization.

Presented are thirty-three discussion papers dealing with the use of computer techniques and automation to facilitate water resources development planning and management. Many of the articles present case studies to illustrate the application of a proposed methodology, i.e., simulation and/or optimization techniques. Participating countries include the United States, France, Great Britain, West Germany, Russia, the Netherlands, Romania, Finland, and Hungary. The papers are organized under the following three principle topics: (1) general objectives of the use of computer techniques and automation for water resources systems; (2) water quality and quality models for planning; and (3) socio-economic models for planning. The symposium as a whole supports the use of computerized methods to aid in the solution of national and regional complex, comprehensive water planning and management problems. In a broad sense, any equipment and organization aimed at satisfying water demands in quantity and quality, satisfying power demands, and protecting man, his environment and his production tools against flood damage and pollution may be considered as a water resources project. When the study concerns a one-structure project, aimed at satisfying only one demand, i is often possible to make estimations with simplified methods, although even in this case using mathematical models may be very useful. For projects involving several structures, various sources of water and multiple uses, it becomes quite impossible to process without using sophisticated methods. Simulation of operating management is then one of the methods which may be used. This article discusses the principle of simulation and describes a water system and its operation. Considered also are the organization of a model for simulation (programme) and input data and their statement. (See also W76-12535) (Bell-Cornell)

USE OF SIMULATION MODELS FOR THE EVALUATION OF A REGIONAL WATER-RESOURCE SYSTEM,
Water Resources Board, Reading (England).
D. G. Jamieson.
In: The Use of Computer Techniques and Automation for Water Resources Systems, Washington, D.C., 1974, Volume II, p 19-23. 1 fig, 5 ref.

Descriptors: *Water resources development, *Simulation analysis, *Regional analysis, Evaluation, Mathematical models, Optimization, *Planning, *Design, Reservoir storage, Computers, Computer programs, Water supply, Water quality, Systems analysis, Flow.
Identifiers: Storage capacity, Synthetic flow data.

In the United Kingdom, piecemeal promotion of new reservoir schemes by local authorities is being superseded by planned development of water resource systems on both a regional and national basis. Each new addition of storage is now considered as an element of a much larger system and must be assessed in conjunction with other existing and proposed storages in that system. Planning models have been formulated for purposes of identifying a limited number of near-optimal least-cost solutions for satisfying the forecast water demands. But since planning models are restricted to using simple evaluation routines, the assumptions made in deriving the near-optimal solutions need substantiating. This process is referred to as the design stage, its purpose being to define the storage capacity and pump sizes of each new element in order to meet the water demands on the total system and any water quality constraints with a given acceptable reliability. This paper considers the design stage of water resource planning; discussed are traditional techniques, simulation of water quantity, simulation of water quality, and optimization. Identifiers: Morphological aspects.

The use of models of whatever kind is prompted by the fact that they enable us to study and understand processes under existing or future conditions without interfering with the actual prototype situation. Presented is a detailed, comprehensive study of the use of mathematical modeling to solve water quality and quantity problems. Considered are computational methods, including one- and two-dimensional models. A number of one-dimensional problems is discussed: (1) water management in drainage networks; (2) water management in the Delta (Netherlands) region; (3) high discharges along the Rhine branches; (4) cooling water circulation; (5) water quality in storage basins; and (6) waste water in estuaries. Two-dimensional problems studied are: (1) waste concentrations on the coast; (2) waste water in estuaries; and (3) steady flow in lakes. Discussed finally are morphological aspects. In conclusion, in many cases it is possible to obtain reasonable results with fairly simple tools. A major drawback is that many models contain some empirical parameters which must be determined anew for each new application. (See also W76-12535) (Bell-Cornell)

Identifiers: *England, *Wales, Integer programming, Cost minimization.

The geographical and temporal distribution of rainfall in England and Wales causes a problem of water conservation and creates the need for a comprehensive strategy of water resources development. This article describes a modeling methodology for determining an economically optimal development, including the capital investment decision of which resources to develop and the decision of which demand centers to supply. Using integer programming, the first model provides a full search of the alternative development programs and minimizes the objective function. Then a simulation model, based on a suite of programs, computes annual water allocations and a detailed breakdown of costs. The six basic stages in the simulation model analysis are outlined. Included is the determination of the optimal plan of the staging and sizing of pipe and pumps. The maximum flow is used to size the plant and the average flow is used in computing the running costs. The final stage computes the total annual incidence of costs and discounted costs. (See also W76-12535) (Bell-Cornell)

Identifiers: Cost minimization.

Presented is a method for water resources development planning and allocation intended to eliminate as much as possible the drawbacks of existing methods. Given the growing complexity of water management problems, most methods are insufficient. Existing methods artificially divide into fragments the unitary character both of water utilization phenomena and water resources development systems. Moreover, problems of quality and quantity are approached separately. Not enough consideration is given the interrelationship between the internal expenses of water users and the external expenses of water resources developmet works. Assumptions and principles of the proposed method are given. Considered are the elements and relationships regarding technological and economical aspects of water utilization by each user. Using the new methodology, optimization of the dimensioning and operation elements of a water system is considered. The optimization criterion is to minimize system costs. Utilized are dynamic programming and simulation analysis. Advantages of the method include: the possibility of establishing the transition mode from the natural flow regime to the developed flow regime of the source; and allowance for a judicious calculus of penalties that must be paid by water users that deviate from optimal strategy of system dimensioning or operation. The optimum distribution of water resources of a country by areas and branches of the national economy is the necessary condition for their rational use, expecially in the territorial redistribution of river flow. In the USSR, different variants of using water resources are assessed from the viewpoint of investments for the creating of national economy complexes. Hence models for optimizing water distribution are investment-type models. Financial expenditures include annual operation expenses and depreciation. Choice of the optimum variant of the distribution of water resources is made by the minimum of the 'discounted' expenditure. This report deals with a model for optimizing the use of interbasinflow transfer by the branches of the national economy and areas on the stage of designing and long-term planning. For problem solution, a model of inter-area, inter-branch and intra-brach optimization has been elaborated, simulating an upper level of the development of the economy. The model consists of hierarchically subordinated blocks describing a complex economic system. (See also W76-12535) (Bell-Cornell)

OPTIMAL DEVELOPMENT PROGRAMME FOR REGIONAL WATER SUPPLY SYSTEMS,
National Water Authority, Budapest (Hungary).
I. Orloci.
In: The Use of Computer Techniques and Automation for Water Resources Systems, Washington, D.C., April 1974, Vol. II, p 166-169.

Descriptors: *Water supply development, *Regional development, *Economics, *Optimization, *Mathematical models, Water demand, Systems analysis.
Identifiers: *Hungary, Cost minimization.

This article considers an economic optimization model which has been applied in preparing a water supply development program in an important industrial region of Hungary. The model is associated with economic measures which are realized in the increase of the capacity of waterworks. The criterion for optimal operation is the sum of damages due to unsatisfied demands resulting from the expensiveness of measures and the limited funds of investment. The model is divided into three main parts: (1) the background of operation, comprising the natural-social processes; (2) the siting model, involving the building-block system construction of potential engineering solutions; and (3) the scheduling of investments. In the course of mechanical computations, the optimal parameters of the water supply system corresponding to average evolution have been determined on the basis of about 500 criteria from around 800 decision alternatives. Identifiers: *Hungary, Developing countries.

In the evolution of water management, the complete, comprehensive control of runoff, as well as the utilization of water resources to the maximum possible engineering and economic benefits at the simultaneous observation of the highly complex interrelations between regional, sectorial, social and economic interests, emerge as problems of growing significance. The main problems of decision making to meet these demands and a scheme of the system of mathematical models corresponding is given. The decision is directed at the determination of the combination of water management hydro-technical projects satisfying optimally various interests, with due consideration to economic, natural legal, political and social interrelations and allowance for the laws of physics, as well as for other effects anticipated in other domains of life and the natural environment. A long-range planning model for water supply has been evolved in Hungary. The model is a linear, deterministic programming model which functions dynamically by the determination and defined interrelations of its variables. (See also W76-12535) (Bell-Cornell)

Identifiers: USSR.

The large-scale development of water resources systems imposes more stringent requirements for water object design, construction, and operation. One of these is to make technical and economic provisions for water projects. Great progress has recently been made in the USSR in developing optimization methods for water resources systems, but a lack of needed statistical, project, and economic planning information impedes the introduction of advanced mathematical-economical models and hampers efficient management. The introduction of a system for data collection, transmission, processing and analysis, the development of methods for water resources optimization, and the large-scale application of automatic devices and instruments facilitate transition to automatic optimized water resources management systems. Listed herein are the optimization tasks, the basic information needed to solve operating conditions optimization tasks, and the technical and economic data required for systems optimization. The use of computers to facilitate the comprehensive, complex information gathering, storage and retrieval is discussed. (See also W76-12535) (Bell-Cornell)

Available from the National Technical Information Service, Springfield, VA 22161 as PB-257 545, $5.00 in paper copy, $3.00 in microfiche. Completion Report, (1975). 90 p, 4 fig, 9 tab, 56 ref. OWRT A-020-Vt(1). 14-31-0001-5046.

Descriptors: Communication, River basins, Water resources, *Social participation, *Vermont, Water quality, Planning, Social aspects, *Attitudes.
Identifiers: *Public participation, *Winooski River Basin(Vt).

Public participation is a dynamic communication process within a social system, a source of information and support for social and economic goals. Current interest in citizen participation is sparked by changes in social values and more specifically by a change in the public's perception of government responsibility. Vermont is drawing up its River Basin Water Quality plans for the major rivers of the State. Agencies have called for citizen input. This provided an opportunity to test a commonly used workshop technique for involving citizens against a second format which involved a more social-psychological orientation and small group problem-solving techniques. The purpose of this project was to test the hypothesis that differences in environmental settings reflect, and are reflected in citizen motivation levels to become involved in water resource decision-making. Two distinctly different types of meetings were held in the Winooski River Basin. A secondary focus was an analysis of citizen motivations to become involved as reflected in questionnaire responses and attendance rates. Participants for this study were found by use of a variation of the technique developed to identify 'community influentials'. Differences found, due to the environmental settings, reflect research findings observed in more 'controlled' experimentation.

Established is a systems conception for problems of the environment which will serve as foundation for eleven recommendations upon the ways in which research and development efforts in this area may beneficially be redirected. Scientific and managemental approaches to the environment have become fettered by a narrowness of perspective that has limited their potential contributions. Viewpoints adopted in directing and performing research activities should be broadened (1) in geographical extent, (2) in conceptual reach, (3) to embrace more environmental systems, (4) to consider natural systems explicitly, (5) to account for the interconnections of the environment with other social systems, and (6) to heed the social system through which the environment is maintained. Presented are three models of the encompassing social system as it affects the environment. The models feature: a micro-economic view of the firms and households which may despoil the environment; the basic political mechanisms through which environmental wrongs can be set right; and the network of information flows necessary to manage the environment. These systems are examined to identify their weaknesses and discover points of leverage where improvements may be effected. Special attention is devoted to: the distributional equity of proposed policies; the possibilities for direct management of environmental systems; the need for preparation in advance of environmental disasters, the establishment of standards, and environmental monitoring. Finally, the study identifies environmental responsibilities at the international level which crucially require fulfillment. (Bell-Cornell)

Planning for the management and use of water resources depends first on the political aims of development and secondly on the consequences induced by the application of these programs. The characteristic of these two types of variables is to imply essentially an important part of nonnumerical values. More precisely, the classical cost benefit analysis only takes into account the market values. However, for progress, a larger methodology, taking into consideration the nonmerical character of the out-of-market variables the environment is needed and has been developed. In order to develop concrete procedures, a group of nine inter-disciplinary teams is experimenting on the 115.000 sq. km basin of the Agence Financiere 'Adour-Garonne' in France. The general attempt is to build as large as possible, using the best available tools, and to study the different aspects related with complex problems, such as the variations of certain parameters with policy. Since programming helps to clarify and optimize the objective function and big computers may handle large systems efficiently, the natural method is to try and represent the problems by a model which can be programmed. Information is presented on the organization of outdoor recreation research in the United States, listing of recreation specialists contacted, comments concerning important U.S. research reports and books on the subject, and a portion of the results obtained in the study. The study includes sections on Texas, Washington, D.C., Michigan, Wisconsin, Colorado, Wyoming, Utah and California. Various public agencies, Federal and State, are discussed in some detail. Concluding remarks indicate that public involvement in providing recreation opportunity at all levels is an essential element. Three federal departments have major research responsibilities: (1) the Department of the Interior, where the Bureau of Outdoor Recreation concentrates on nationwide planning with statewide outdoor recreation coordinated through regional offices. Research is conducted by universities or independent institutions under BOR sponsorship; (2) The Department of Agriculture where research is conducted by regional Forest Range and Experiment Stations and Agricultural Experiment Stations; (3) The Corps of Engineers which has an active research program related to future reservoir planning. Almost all research programs at the state level are related to the Statewide Comprehensive Outdoor Recreation Plan (SCORP). A multiple regression analysis is used to determine the influence of socio-economic factors and independent variables upon participation rates. It is thought that Western European countries can benefit from studying the way recreation planning is done in the U.S., though the vastness of the land obviously gives recreation in the U.S. some unique characteristics. MANAGEMENT OF WATER RESOURCES UNDER DIFFERENT SOCIO-ECONOMIC CONDITIONS,
Arizona Univ., Tucson.
S. M. H. Bokhari.
Available from University Microfilms, Inc., Ann Arbor, Mich. 48106. Order No. 76-11, 320. Ph.D. Thesis, 1975, 306 p.

Descriptors: *Water management(Applied), *Planning, *Social aspects, *Regional economics, *Regional development, Regional analysis, United States, Asia.
Identifiers: *Pakistan, Welton-Mohawk Irrigation District.

Major lags still exist between the developed and developing countries with respect to water management, and theory and practices diverge even in the developed countries. The Wellton-Mohawk Irrigation District in the United States and the Salinity Control and Reclamation Project Number One in Pakistan are compared as examples of water management under different sociological conditions. Multi-disciplinary teams of professionals from developing countries should be trained to make planning and management more effective. Implementation capabilities in developing countries should be improved, so that projects can be completed more rapidly. Adequate financial allocation is required during implementation and operation. The latest rain harvesting and runoff agricultural techniques should be introduced in dry farming area in Pakistan's upland plateau. Tubewells will make the system more flexible and save funds for important complementary programs. There should be more emphasis on planning, operations, and evaluation of public investments concerned with water. (Snyder-FIRL)

Descriptors: *Water supply, *Forecasting, *Industrial water, *Water quality, Water demand, Industries, Planning, Hydraulics, Methodology, Management.
Identifiers: *Southwestern France.

In hydraulics development schemes, supply and demand are expressed by the same physical quantity. From such data, planning bodies try to optimize water supply management to meet various potential uses. Today, this methodology is no longer satisfactory; the supply concept itself must be re-defined. Water management patterns must account for each and every parameter of quality. Presented is a method for forecasting industrial water supply. To each area of use, the pattern connects a five-dimensional request vector, determined from an inquiry made in southwestern France. Five ranges of water use for manufacturers have been examined: (1) waters used for conveyance; (2) cooling waters; (3) heating waters; (4) manufacture waters; and (5) sanitary and home waters. Results show that factories having identical products manufactured require very different unitary water quantity vectors. The results are aggregated for the whole industrial areas of the investigated zone, including the five uses mentioned and seven activity areas corresponding to an industrial amalgamation used in the national statistics. NORTHEASTERN UNITED STATES WATER SUPPLY STUDY, INTERIM REPORT, CRITICAL CHOICES FOR CRITICAL YEARS.
Army Engineer Div. North Atlantic, New York.
November 1975. 89 p, 16 fig, 7 tab, 97 ref.

Descriptors: *Water supply, *Water demand, *Water shortage, *Water resources development, Population, *New York, *Massachusetts, *Rhode Island, *Water management, Water quality, Water reuse, Water yield improvement, Droughts, Planning, *District of Columbia.
Identifiers: *Washington Metropolitan Area, *New York Metropolitan Area, *Eastern Massachusetts-Rhode Island Metropolitan Area.

Critical problems of developing water supply sources to meet growing demand are foreseen in the next 20 to 25 years for 3 metropolitan areas, Washington, New York and Eastern Massachusetts-Rhode Island. Major alternatives for water supply, along with advantages and disadvantages, are examined so that responsible government decisions can be made. Population projections were used to year 2020 to predict water demand. Possible supply alternatives were identified for each area to determine critical needs. By 2020 population of 80 million is predicted for this region which extends from Maine to Virginia. Along with the 3 critical metropolitan areas explored here, 26 other urban areas with potential long range problems have been studied in a separate report. Solutions offered must meet 4 criteria: reliability, flexibility, timeliness, and equity. Underlying premises are: demand will increase with population and economic growth, direct reuse of waste water will not be widely accepted, there will be no changes in ownership of water supplies, droughts will continue to occur, and demand cannot be materially reduced through legislation or changing habits before the 1990s. No major water supply projects have been built in the critical areas since the 1960s yet safe yields in some systems have been repeatedly surpassed. It is noted that considerable increase in price (in multiples of 100%) is needed to affect demand. Sources, projects and illustrative combinations of projects are given for each critical area. Several branches of a decision tree are explored, each considering a different mix of goals such as cost, environmental quality, regional needs, reliability and equity. (Smith-North Carolina)

GROUNDWATER PROPERTY RIGHTS AND CONTROVERSIES IN MONTANA,
Montana State Univ., Bozeman. Dept. of History, Government and Philosophy.
R. Dunbar.
Available from the National Technical Information Service, Springfield, VA 22161 as PB-257 516, $5.00 in paper copy, $3.00 in microfiche. Research Report No. 76, Montana University Joint Water Resources Research Center, Bozeman, April 1976, 75 p. OWRT A-059-MONT(1).

Descriptors: Water law, *Groundwater, *Property rights, *Water rights, *History, Prior appropriation, *Montana, Regulation.
Identifiers: *Water law history, *Montana water law.

When Montana was dubbed the Treasure State, few of her citizens were aware of the abundance of groundwater beneath their feet. Nor were they concerned about the property right in it, a right which their lawmakers had borrowed from the more humid states. However, as Montanans began to learn through hydrologic surveys the extent of the resource and to increase its exploitation, some farsighted individuals sought first to conserve it through regulation of the right and then to change the right itself. These efforts provoked controversies. Out of the crucible of these controversies, Montanans forged a new property right and new institutions to protect it. This report is an historical analysis and accounting of these controversies. (Holje-Montana State)

REFORM OF ILLINOIS WATER RESOURCE LAWS WITH PARTICULAR REFERENCE TO THE DRAINAGE CODE AND CLOSELY RELATED LAWS,
Illinois Univ. at Urbana-Champaign. Dept. of Agricultural Economics.
D. L. Uchtmann, and N. G. P. Krausz
Available from the National Technical Information Service, Springfield, VA 22161 as PB-257 53[illegible] $5.00 in paper copy, $3.00 in microfiche. Illinois Water Resources Center, Urbana. Research Report No. 114, June 1976. 94 p, append. OWRT A-076-ILL(1). 14-31-0001-6014.

Descriptors: *Water districts, Organization, *Jurisdiction, *Institutions, Government, *Planning, Control, Regulation, Coordination, *Illinois, Water law, Water rights, Legal aspects, *State governments, Drainage districts, Legislation.
Identifiers: *Drainage codes(Law).

Laws affecting Illinois water resources form a highly complex and fragmented water resource system. Many special purpose or general governmental units have varying responsibility in areas of drainage, soil and water conservation, sewage treatment and water quality, water supply and use, flood control, recreation and navigation. This existing structure gives rise to numerous inherent problems. Each state adjoining Illinois has made significant changes in its system for administering and controlling water. In addition, Nebraska, Ohio and Florida have made significant changes in their water systems. The water law programs of these states have been analyzed to determine what procedures and structure might be adopted for Illinois. Regarding drainage laws, in particular, a survey of drainage district attorneys and engineers in Illinois identifies specific areas of dissatisfaction. The surveys also offer suggestions for improvement. Recommendations for reform of Illinois water resource laws include a long term reform of the overall structure. This long term recommendation includes the establishment of a state agency with broad powers in areas of general planning and coordination and the combining of many existing local special purpose districts into multi-purpose local districts. The recommendations also include specific changes to the existing drainage code that can be accomplished independent of the overall restructuring.

oll-free use of the nation's inland waterway ansportation network is shown to be a political nd economic anachronism. The historical evelopment of this free-use policy is traced from e early days of promotion of regional economic evelopment under the legal sanctions of the com-erce Clause of the Constitution and the orthwest Ordinance. In an age of scarce funds r public works, the toll-free waterway program ems to be an outstanding candidate for applica-n of the 'beneficiaries pay' principle. Equity nsiderations, promotion of efficiency between nsport modes, and public investment efficiency nsiderations suggest that a revision might be al in theory but would likely face substantial litical opposition in practice. MULTIPLE-USE CONFLICTS BETWEEN FISHERMEN AND OTHER USERS OF THE OCEAN WITH A CONSIDERATION OF A POSSIBLE EXPANDED FEDERAL ROLE,
National Oceanic and Atmospheric Administration, Rockville, Md., Office of Living Resources.
R. F. Smith.
In: Gulf and Caribbean Fisheries Institute, Proceedings, Twenty-Eight Annual held in Bal Harbour, Florida, October 1975, May 1976. p. 27-34.

Descriptors: *Continental Shelf, *Resources development, *Environmental effects, *Fisheries, *Recreation demand, *Commercial fishing, *Governmental interrelation, Coasts, Planning, Multiple purpose.
Identifiers: *Outer Continental Shelf.

This paper considers the various types of multiple-use conflicts faced by commercial fishermen, and reviews the role of the Federal Government in helping fishermen and workers in other industries to make a living on the same ocean at the same time. The physical, economic, and social aspects of ocean development that may affect the abilty of fishermen to function effectively under mounting multiple-use conflicts are discussed. These problems are not new; but they are no longer localized to a few fishing ports or on isolated fishing grounds. Instead, they occur coast-wide--indeed, worldwide. They are becoming far more complex and have potential impacts upon many more fishermen. The conflicts occur because of competition for ocean space and port facilities, competition for labor and service, and pressures upon the fishermen to change his life style. Such competition and pressures may cause injury, endanger lives, damage vessels and gear, create costly delays, or force a fisherman against his will into other occupations or social patterns. In summary, we are moving into an era of dramatically increasing activity and development throughout most of our continental shelf area. This will have a tremendous impact on the economy and social patterns in many of the nation's coastal communities, and the ultimate effects are difficult to predict. The fact is that there are no major technical problems impeding ocean development that are beyond the capacity of science and engineering to solve. The real problem is in the resolution of social economic, and other multiple-use conflicts. (See also W76-12226) (Sinha-OEIS)
W76-12227

IDENTIFICATION AND MAPPING OF FISHING BANKS ON THE OUTER CONTINENTAL SHELF OF THE GULF OF MEXICO,
Bureau of Land Management, New Orleans, La.
D. Elvers, and J. B. Johnston.
In: Gulf and Caribbean Fisheries Institute, Proceedings, Twenty-Eighth Annual held in Bal Harbour, Florida, October 1975, May 1976. p 35-48, 7 fig, 2 tab, 22 ref.

Descriptors: *Continental Shelf, *Gulf of Mexico, *Environmental effects, *Resources development, Water resources, *Leases, Fish, Management, Mapping, Drilling.
Identifiers: *Outer Continental Shelf, Fishing banks, Fishing grounds, Environmental impact.

The Bureau of Land Management (BLM) began leasing in Gulf federal waters for oil, gas, and sulfur in 1954. Between 1954 and 1971, 23 lease sales were held with the value of the prospects the principal factor guiding the sales. In 1971, formal environmental impact statement preparation began and by 1973 concern for fishing banks, shrimping area, shipwrecks, and coral reefs brought about special stipulations in the Florida Middle Ground, Stetson Bank, East and West Flower Garden banks, and 18 Fathom Lump. Fishing grounds related to bathymetric and geologic features for the Gulf of Mexico can be accurately mapped with modern navigation, side scan sonar, and narrow beam soundings. BLM hopes to add additional details to fishing grounds by use of BLM, NOS, and industry data taken in the course of special studies for impact statements, baseline investigations, archaeologic, and geologic hazard surveys for the Gulf of Mexico and South Atlantic continental shelf and slope. Identifiers: *Fish species diversity, *Big Walnut Creek(Ohio), Hoover Reservoir(Ohio), Scioto River tributory(Ohio).

The accumulated effects of impoundment on Hoover Reservoir have altered the composition and distribution of fishes in Big Walnut Creek. These changes in part have resulted from inundation of the stream channel, prevention of migration, alteration in water velocity, substrate turbidity, temperature and dissolved oxygen. These alterations either directly or indirectly affect species by changing the stream's ecology. Temperature was reduced significantly in the tailwater area affecting the reproductive biology of as many as 22 species of fish that normally migrate to spawn. Turbidity levels fluctuated widely, but were dampened in the tailwater area due to settling action in the reservoir allowing two species of turbidity-intolerant fish to become established. Dissolved oxygen levels never fell below the recommended level of 5 ppm, but the effects of a reduced oxygen level on food organisms are unknown. Widespread changes in the overall fish fauna of Big Walnut occurred as a result of impoundment. Five separate statistical analyses demonstrated these changes. In addition to commonly used indices, a new technique, correlation analysis, was a useful tool in describing how the associations between fish species in communities are changed by impoundment. It was established that diversity (H) at selected stations above and below Hoover Reservoir on Big Walnut remained unchanged, while significant changes occurred in the qualitative makeup of the fish fauna. This indicates that diversity (H) used in conjunction with descriptive analysis provides an overall description of changes resulting from stream impoundment.

FLOOD-HAZARD EFFECTS ON RESIDENT PROPERTY VALUES,
Virginia Polytechnic Inst. and State U Blacksburg. Dept. of Agricultural Economics.
L. A. Shabman, and D. I. Damianos.
Journal of the Planning and Management Divis Proceedings of the American Society of Civil gineers, Vol 102, No WR1, p 151-162, April, 4 tab, 10 ref.

Descriptors: Water resources, Floods, *F damage, *Hazards, *Flood control, Zo Prices, Land, Equations, Systems anal Regression analysis, Flood plain insurance.
Identifiers: Multiple regression anal Economic analysis, *Flood hazards.

Inasmuch as the potential for flooding can re property values, individuals will be encourag promote government policies that reduce damages of flooding, such as dams or subsi flood insurance. On the other hand, policies limit the use of flood-prone land may reduc value of such land even beyond the reductio to flooding potential. Thus, political choice m biased toward structural or property-enha measures as opposed to measures which re property values, regardless of what the so 'best' set of measures might be. To empirical vestigate the validity of the preceding argum the influence of flood hazard on residential perty values has been estimated, examining case study areas. Use of multiple regression a sis to analyze actual sale prices of land parce indicated that: (1) the existence of flood lowers land value; (2) structural flood-c measures increase land prices; and (3) th fluence of flood-plain zoning cannot be identified. Identifiers: Economic optimum.

CORNELL U. DEPT. OF L. URBANA-CHAMPAIGN

ociety may use cost-benefit analysis to set priori-
es in determining the level of environmental pol-
tion they wish to tolerate. The benefits of pollu-
on are derived from the production and con-
mption of goods and services necessary to life.
he estimated social costs of this productive ac-
vity are the costs necessary to reduce or
iminate the wastes from the effluents discharged
to the environment. Therefore, cost-benefit
alysis is appropriate in environmental decision
aking since its proper use insures that society
n reach the ecological stability level without
olating the economic optimum. However,
ological stability may not always be a rational
oice, particularly when dealing with ecological
b regions rather than the global ecosphere. (Bell-
rnell)

OWANCE FOR THE STOCHASTIC
RACTER OF HYDROLOGICAL DATA IN
TER PROJECT DECISIONS,
onal Water Authority, Budapest (Hungary).
neering Secretariat.
J. Csuka.
Hydrological Sciences Bulletin, Vol. 21, No. 1, p 61-68, March 1976. 1 fig, 4 ref.

Descriptors: *Stochastic processes, *Hydrologic data, *Water management(Applied), *Risks, Value, *Decision making, Water supply, Water resources, Water, Water demand, Irrigation water, Equations, Water utilization, Model studies.
Identifiers: *Water project decisions, Irrigation water supply, Water supply time series, Annual net benefits, Risk pool.

A method was presented for formulating the operating model of water use that included the uncertainty related to the hydrological factors in water management decisions. The model was used for simulating a long time series for water supply, on the basis of which economic data were generated with the help of specific economic indices. The risk pool was estimated, and in the case of project alternatives, decisions allowing for uncertainty were based on the investment costs including the risk pool. Where the costs of risks associated with the alternative selected could be charged, together with the relevant costs against the user, the problem became one of calculating the water rate including risk. The water rate was the annual cost of operation plus the profit and was obtained as the ratio of the water volume delivered. (Roberts-ISWS)

RADAR DERIVED SPATIAL STATISTICS OF SUMMER RAIN - EXPERIMENT DESCRIPTION,
Johns Hopkins Univ., Laurel, Md. Applied Physics Lab.
I. Katz, A. Arnold, J. Goldhirsh, T. G. Konrad, and W. L. Vann.
Contractor Report NASA CR-2592, Vol. I of III, September 1975. 87 p, 21 fig, 8 tab, 56 ref. NASA/DOD S-70248AG.

Descriptors: *Virginia, *Radar, *Rainfall, *Data processing, Analytical techniques, Equipment, Instrumentation, Antennas, Projects, Rain, Precipitation(Atmospheric), Summer, Statistics, Weather, Storms, Attenuation, Communication, Remote sensing, Monitoring, Measurement, Meteorology, Electrical engineering.
Identifiers: *Wallops Island(Va), *Radar-weather, Space communication, Rain cell statistics.

An experiment was performed at Wallops Island, Virginia, to obtain a statistical description of summer rainstorms. Its purpose was to obtain information needed for design of earth and space communications systems in which precipitation in the earth's atmosphere scatters or attenuates the radio signal. Rainstorms were monitored with the high resolution SPANDAR radar and the 3-dimensional structures of the storms were recorded on digital tape. Volume I of this series described the equipment, the experiment and tabulated all data obtained during the experiment. (See also W76-12179 and W76-12180) (Sims - ISWS)
W76-12178

RADAR DERIVED SPATIAL STATISTICS OF SUMMER RAIN - DATA REDUCTION AND ANALYSIS,
Johns Hopkins Univ., Laurel, Md. Applied Physics Lab.
T. G. Konrad, and R. A. Kropfli.
Contractor Report NASA CR-2592, Vol. II of III, September 1975. 171 p, 97 fig, 10 tab, 10 ref. NASA/DOD S-70248AG.

Descriptors: *Radar, *Rainfall, *Virginia, *Data processing, *Analytical techniques, Precipitation(Atmospheric), Rain, Summer, Weather, Mathematical models, Statistical models, Statistics, Communication, Attenuation, Remote sensing, Measurement, Meteorology.
Identifiers: *Radar-weather, *Wallops Island(Va), Space communications, Rain cell statistics, Rain cell descriptions.

Volume II of the three volumes constituted the final report on the rain statistics program. In this volume, the data reduction and analysis procedures were discussed along with the physical and statistical descriptors used. The statistical modeling techniques were outlined and examples of the derived statistical characterization of rain

cells in terms of the several physical descriptors were presented. Recommendations concerning analyses which can be pursued using the data base collected during the experiment were included. (See also W76-12178 and W76-12180) (Sims - ISWS)
W76-12179

RADAR DERIVED SPATIAL STATISTICS OF SUMMER RAIN - APPENDICES.
Johns Hopkins Univ., Laurel, Md. Applied Physics Lab.
Contractor Report NASA CR-2592, Vol. III of III, September 1975. 212 p, 4 append. NASA/DOD S-70248AG.

Descriptors: *Radar, *Virginia, *Rainfall, *Data processing, *Equipment, Electrical engineering, Calibrations, Antennas, Meteorology, Remote sensing, Measurement, Analytical techniques, Meteorological data, Weather data, Statistics.
Identifiers: *Radar-weather, *Wallops Island(Va), Radar-video processor, Radar calibrations, Frequency diversity.

Volume III, Appendices of the Final Report on rain statistics, is a collection of selected important memoranda written during the course of the experiment. The titles of memoranda are: (1) A Frequency Diversity Source Developed for Rain Statistics Program, (2) Technical Manual for Propagation Experiment Controller and Radar Video Processor, (3) SPANDAR Calibration Activities, and (4) Meteorological Summaries for Periods of SPANDAR Rain Observation May Through August 1973. (See also W76-12178 and W76-12179) (Sims - ISWS)
W76-12180

A STUDY OF THE UTILIZATION OF ERTS-1 DATA FROM THE WABASH RIVER BASIN,
Purdue Univ., Lafayette, Ind. Lab. for Applications of Remote Sensing.
D. A. Landgrebe.
Available from the National Technical Information Service, Springfield, Va 22161 as N75-27 522, $10.50 in paper copy, $3.00 in microfiche. LARS Informative Note 052375, Final Report, August 1974. 337 p, 93 fig, 54 tab, 15 ref. NASA NAS5-21773.

Descriptors: *Remote sensing, *Illinois, *Indiana, *Missouri, *Idaho, *Kansas, *Wisconsin, *Satellites(Artificial), *Data processing, Mapping, Crops, Agriculture, Soils, Soil classification, Land use, Land classification, Urbanization, Water resources, Surface waters, Lakes, Rivers, Land resources, Vegetation, Equations, Forests, Aerial photography, Analytical techniques.
Identifiers: *ERTS, Chicago(Ill), Gary(Ind), *Lake Freeman(Ind), *Lake Shafer(Ind), Milwaukee(Wis), Finney County(Kan), Tippecanoe County(Ind), Marion County(Ind), White County(Ind), Indianapolis(Ind), Cook County(Ill), Milwaukee County(Wis), *Wabash River Basin.

The general objectives were: (1) to evaluate the applications of ERTS-1 measurements which have been appropriately reduced for use in specific earth resources problems, and (2) to determine the desirable measurements needed in future earth resources systems. Five scientific investigations were reported which were pursued to evaluate the applications of ERTS-1 measurements to specific earth resources problems. To further support these objectives, four specific supporting technology tasks were also included. The nine tasks were all based on the use of digital computer techniques for studying ERTS data in digital form. The conclusions for this study were numerous and were included in each of the nine sections describing results for each project. The overall conclusions were that ERTS-1 data shows potential for crop mapping, urban land use mapping, and water resources mapping. Less favorable results were observed for soil association mapping and earth surface features identification; however these studies were limited in scope. (Sims -ISWS)

Journal of the Waterways, Harbors and Coastal Engineering Division, American Society of Civil Engineers, Vol. 102, No. WW2, Proceedings Paper 12150, p 189-202, May 1976. 9 fig, 4 ref, 1 append.

Descriptors: *Remote sensing, *Aerial photography, *Rivers, *Mississippi River, *Infrared radiation, Photography, Sediments, Temperature, Aerial photography, Turbidity, Potamology, Sedimentology, Flow, Eddies, On-site investigations, Floods.
Identifiers: *Aerial infrared photography, *Thermal infrared imagery.

The Corps of Engineers, Vicksburg District, initiated a data collection program to develop a workable knowledge of the principles relating to the transport of water and sediment to gain a better understanding of the Mississippi River characteristics. Aerial photographs and thermal infrared imagery were collected over two test reaches at low and high water stages. Qualitative interpretation of the data related to the river characteristics such as flow patterns, relative velocities, sediment concentration distribution, water-depth effects, and effects of man-made structures. Ground truth information was correlated with the remotely sensed data. (Sims-ISWS)

Geological Survey, Harrisburg, Pa.
R. M. Beall.
Open-file report 76-352, May 1976. 12 p, 1 plate, 33 ref.

Descriptors: *Basic data collections, *Hydrologic data, *Sites, *Maps, *Pennsylvania, Precipitation(Atmospheric), Temperature, Streamflow, Gaging stations, Stage-discharge relations, Water quality, Surface waters, Groundwater, Water levels.
Identifiers: *Pittsburgh region(Pa).

Active primary-collection sites for hydrologic data are shown on a map of the Greater Pittsburgh region (Allegheny, Armstrong, Beaver, Butler, Washington, and Westmoreland Counties in southwestern Pennsylvania). The sources of data--by publication or responsible agency--are described. Secondary data collection sites have not been shown on the map, but several agencies involved in this activity have been listed. Hydrologic data are collected at the following numbers of identified sites under the auspices of Federal, State, and interstate organizations: Precipitation or temperature 39, surface-water stage or discharge 82, surface-water quality 69, and ground-water levels 7. QUALITY OF SURFACE WATERS OF THE UNITED STATES, 1970: PARTS 12-16. NORTH PACIFIC SLOPE BASINS, ALASKA, AND HAWAII AND OTHER PACIFIC AREAS.
Geological Survey, Reston, Va.
Available from the Supt. of Documents, GPO, Washington, DC 20402, Price $4.70. Water-Supply Paper 2160, 1976. 501 p, 1 fig.

Descriptors: *Water quality, *Surface waters, *Sediment transport, *Water temperature, *Pacific Northwest U.S., Alaska, Hawaii, Basic data collections, Water analysis, Chemical analysis, Water chemistry, Physical properties, Particle size, Streamflow, Sampling, Sites.
Identifiers: *North Pacific Slope basins.

During the water year ending September 30, 1970, the Geological Survey maintained 285 stations on 205 streams in the North Pacific Slope basins, Alaska, and Hawaii and other Pacific areas, for the study of chemical and physical characteristics of surface water. Samples were collected daily and monthly at 158 of these locations for chemical-Quality studies. Samples also were collected less frequently at many other points. Water temperatures were measured continuously at 235 and daily at 23 stations. Daily water temperatures were measured at most of the stations at the time samples were collected for chemical quality or sediment content. So far as practicable, the water temperatures were taken at about the same time each day. Quantities of suspended sediment are reported for 47 stations during the year ending September 30, 1970. Sediment samples were collected one or more times daily at most stations, depending on the rate of flow and changes in stage of the stream. Particle-size distributions of sediments were determined at 12 stations. The stream discharge reported for a composite sample is usually the average of daily mean discharges for the composite period. The discharges reported in the tables of single analyses are either daily mean discharges or discharges obtained at the time samples were collected and computed from a stage-discharge relation or from a discharge measurement. MAPS SHOWING GROUND-WATER CONDITIONS IN THE HARQUAHALA PLAINS AREA, MARICOPA AND YUMA COUNTIES, ARIZONA--1975,
Geological Survey, Tucson, Ariz.
E. E. Denis.
Water-Resources Investigations 76-33 (open-file report), April 1976. 3 sheets, 3 maps, 6 ref.

Descriptors: *Groundwater resources, *Aquifer characteristics, *Water yield, *Water quality, *Maps, Water utilization, Irrigation, Water levels, Water level fluctuations, Water wells, Depth, Water table, Dissolved solids, Fluorides, *Arizona.
Identifiers: *Harquahala Plains area(Ariz), Maricopa County(Ariz), Yuma County(Ariz).

This 3-sheet map report describes ground-water hydrology and water quality in the Harquahala Plains area in Maricopa and Yuma Counties, Arizona. The map titles are: (1) Change in Water Level, December 1966 to January 1975, and Irrigated Area, 1974, (2) Well Depth and Depth to Water, 1975, and (3) Specific Conductance and

Fluoride Concentration, 1974. Deposits of high permeability and storage are discontinuous lenses of clay, silt, sand and gravel; the sand and gravel are the main water-yielding units. The deposits are from less than 300 feet thick near the mountain fronts to more than 1,200 feet thick in the central part of the area. Ground water generally is under water-table conditions but may be under artesian conditions in places. The long-term withdrawal of ground water has resulted in a general decline in water levels. Water-level declines for 1957-75 were more than 200 feet in all the wells in which depth to water was measured. In the Harquahala Plains area the dissolved-solids concentrations in ground water range from less than 500 to more than 800 mg/liter. (Woodard-USGS)
W76-12299

MAP OF OVERDIP SLOPES THAT CAN AFFECT LANDSLIDING IN ARMSTRONG COUNTY, PENNSYLVANIA,
Geological Survey, Harrisburg, Pa.
W. R. Kohl.
Available from Branch of Distribution, USGS 1200 S. Eads St. Arlington, VA 22202, $.75. Miscellaneous Field Studies Map MF-730, 1976. 1 sheet, 1 map, 8 fig, 1 tab, 8 ref.

Descriptors: *Landslides, *Slopes, *Maps, *Sites, *Pennsylvania, Erosion, Avalanches, Rock mechanics, Geology.
Identifiers: Armstrong County(Pa).

This map shows areas of overdip slopes in Armstrong County, Pa. A slope is 'overdip' where the hill slope is steeper than the inclination of the outcropping rock layers and both slope and layers dip in the same general direction. Symbolized on the map and accompanying explanation are overdip slopes where rock layers are inclined more than 40 feet per mile and areas where rock layers have a lesser degree of inclination or are horizontal. Not symbolized are areas where rock layers dipping more than 40 feet per mile crop out in flat land or on slopes that are not overdip. Localities typifying slope conditions are described. Overdip slopes are significant to the problem of landsliding because: (1) Jointed (fractured) rocks on an overdip slope have no built-in 'mechanical' resistance to downslope movement. (2) The dip of rock layers commonly causes groundwater to percolate to an overdip slope. Water may be the most significant factor in landsliding; the chief agent in lubrication and rock decomposition, as well as a contributor to weight of soil on the slope. The overdip-slope map is but one of a number of tools useful in defining areas where landslides may occur. Others include slope maps, geologic maps, and soil maps. (Woodard-USGS)

Economic Commission for Europe (UN), New York.
In: The Use of Computer Techniques and Automation for Water Resources Systems, Washington, D.C., 1974, Volume II. p 1-6. 8 ref.

Descriptors: *Water resources development, Computers, *Management, *Automation, Planning, Methodology, Design, Optimum development plans, Personnel, Economics, Social aspects, Europe, Operations, Forecasting, Monitoring, Water quality, River basins.

It is generally recognized that water resources management (as well as hydrology) is the least computerized of the physical sciences and technically advanced branches of industry. The existing lag in water management and automated control--explained in the past by the abundance, relative purity, and low cost of water in most industrialized countries--can no longer be justified today. The need to introduce computerized regional dispatching boards in regional control and management has been fully recognized in many ECE countries. This article considers some of the main points deemed important for the effective application of advanced techniques of management of water resources systems. Discussed are: (1) training of personnel for effective application of new tools of management; (2) planning and design of water resources systems with application of computers; (3) computerization and automation to rational operation of water resources systems; and (4) organization and institutional prerequisites for efficient application of computers and automation for water resources management. STRUCTURAL MODEL STUDIES FOR THE HENDRIK VERWOERD DAM,
Wimpey (George) and Co. Ltd., Hayes (England). Wimpey Central Lab.
J. C. Chapman, B. Creber, and P. J. D. Guile.
The Institution of Civil Engineers, Proceedings, Part 2, Research and Theory, Vol 57, p 467-491, September 1974. 22 fig, 1 tab.

Descriptors: *Dams, *Model studies, *Structural models, *Stress analysis, Design, Behavior, Instrumentation, Spillways, Culverts, Gravity, Hydrostatic pressure.
Identifiers: Stress distribution.

The Hendrik Verwoerd Dam has a crest length of 3000 ft with a maximum height of 280 ft, and a storage capacity of 5 million acre feet. The main purpose of the model analysis was to determine the stress distribution in the control structures incorporated in the dam, but because it was found necessary to model the complete dam, much information was also obtained concerning the structural behavior of the dam at working load and at various overload conditions up to failure. The model was built of concrete to a scale of one to a hundred. Gravity load was applied within the body of the dam by vertical wires loaded by hydraulic jacks below the model. The behavior of the model dam under design load was satisfactory and the stresses were of the anticipated order of magnitude; the stresses showed good agreement with the results of a finite element analysis. The vertical tensile stresses in the spillway culvert walls were higher than those which had been estimated by simple calculation. This is due to the effect of the arch thrusts acting on the control structures and it was this effect that the model was particularly designed to study. The results of the model analysis indicated that substantial reinforcement was required in the walls between the spillway culverts to resist the tensile stresses. (Bell-Cornell)

SUPERCRITICAL FLOW AT OPEN-CHANNEL JUNCTIONS; HYDRAULIC MODEL INVESTIGATION,
Army Engineer District, Los Angeles, Calif.
D. A. Barela.
Available from the National Technical Information Service, Springfield, VA 22161 as AD-A014 892, $6.75 in paper copy, $3.00 in microfiche. Report No. 2-100, July 1975. 161 p, 55 photo, 42 plate, 1 tab.

Descriptors: *Open channels, *Junctions, *Supercritical flow, *Model studies, Hydraulic models, Channels, Channel flow, Channel improvement, Turbulence, Waves(Water), Flow, Open channel flow, Structures, Drainage, Drainage systems, Storm drains, Civil engineering, Hydraulics, *California.
Identifiers: *Los Angeles area(Calif), Structure design.

Hydraulic model tests made to generalize and verify the hydraulic design of confluence structures are described. Model investigation of certain confluences showed unsatisfactory flow conditions involving considerable turbulence in the confluence structure and transverse waves in the channel downstream. Major changes in particular designs were effected. Various schemes were introduced in each case. Lengthening the transition downstream from divider wall and minimal angle of intersection of the two channels were found to be the most efficient solutions. (Sims - ISWS)

A LABORATORY EVALUATION OF TRASH RACKS FOR DROP INLETS,
Agricultural Research Service, Stillwater, Okla.
G. C. Hebaus, and W. R. Gwinn.
Technical Bulletin No. 1506, September 1975. 70 p, 76 fig, 24 tab, 2 ref, 1 append.

Descriptors: *Trash racks, *Hydraulic structures, *Hydraulic models, *Spillways, Intakes, Model studies, Laboratory tests, Prototype tests, Testing, Reservoirs, Evaluation, Detention reservoirs.
Identifiers: Drop inlets, Closed conduit spillways.

Performance tests for trash racks on closed-conduit spillways, using one-eighth-scale models, were developed and standardized by comparison with the performance of full-scale prototype structures mounted on a drop inlet to a 2-foot-diameter conduit. Flow data for use in spillway design were collected by testing models and prototypes of standard and experimental designs under a range of flow conditions, with clear water and standardized trash loads. The following recommendations were made: for two-way drop inlets in open water, there should be a rack with a solid plate and a solid skirt extending below the inlet crest level. Ventilation must be provided between the plate and skirt so that siphoning will not occur, unless such action is desired. If the vent is made by leaving an open space between the underside of the plate and the top of the skirt, this open space should be covered with mesh to prevent the entry of sticks. Rack bars should be placed in a plane sloping downward from the bottom edge of the skirt to the side of the drop inlet, to prevent rigid trash, floating alongside the drop inlet at low water, from rising with the water and entering the space between the skirt and the drop inlet side. The rack on the four-way square drop inlet performed well. However, if a rack of this type is used, a mesh-covered ventilation space between the skirt and the plate should be provided. The racks investigated in this study were generally best suited for open-water installations. (Humphreys - ISWS)

INTERACTION OF WATER WAVES WITH CYLINDER BARRIER,
Polish Academy of Sciences, Gdansk. Inst. of Hydraulic Research.
S. R. Massel.
Journal of the Waterways, Harbors and Coastal Engineering Division, American Society of Civil Engineers, Vol. 102, No. WW2, Proceedings Paper 12125, p 165-187, May 1976. 11 fig, 23 ref, 5 append.

Descriptors: *Waves(Water), Hydrodynamics, *Drag, *Coastal structures, Coastal engineering, Analysis, Barriers, Equations, Mathematical studies, Pressure, Velocity.
Identifiers: *Wave forces, *Circular cylinders, Inertia, Mathematical analysis, Diffraction, Transmission coefficient.

The spatial periodic function was used in the investigation of the interaction of water waves with a row of evenly spaced vertical cylinders. The direction of the incident waves was arbitrary. The effect of the neighboring cylinders on the wave force on a given cylinder was derived. The equivalent mass coefficients were calculated. The theoretical results were compared with previous experimental results on the inertia-predominant wave force and on the transmission coefficient for the barrier. (Adams-ISWS)

Descriptors: *Hydrodynamics, *Drag, *Frequency, *Laboratory tests, Waves(Water), Analysis, Froude number, Reynolds number, Hydraulic similitude, Coastal structures, Model studies, Equations, Mathematical studies.
Identifiers: *Wave forces, Inertia, Lift, *Circular cylinders.

Tests were conducted at Reynolds numbers less than 30,000. Hydrodynamic parameters, inertia, drag, and lift coefficients were calculated from the measured force data. Coefficient values obtained for 1 ft sections were used to correlate the measured forces on the entire cylinder. The coefficients correlated well with the period parameter which followed the Froude scale. Resultant forces were found to be as much as 60% higher than the in-line force. Lift coefficients were calculated to the fifth harmonic as functions of the period parameter. The frequencies of the lift force were found to have a definite trend with the number of eddies formed, which depended on the period parameter. Dependence on the period parameter made scaling to other sizes straightforward except for uncertain effects from changing the Reynolds number from subscritical to supercritical. (Adams-ISWS)

THE DEPTH VS. DEPTH PLOT: AN AID TO SELECTING PIEZOMETER INSTALLATION DEPTHS IN BOREHOLES,
Piteau Gadsby Macleod Ltd. North Vancouver (British Columbia).
R. C. Dick.
Engineering Geology, Vol. 10, No. 1, p 37-42, May 1976. 5 fig, 2 ref.

Descriptors: *Depth, *Graphical methods, *Piezometers, *Boreholes, *Stability, Slope stability, Soil water, Soil pressure, Artesian aquifers, Water table, Permeability, Water pressure, Potentiometric level, Reservoir leakage, Water level fluctuations, Perched water, Groundwater.
Identifiers: Anomalies.

The location of the piezometric surface within a soil or rock mass is often the critical factor in stability analysis and in evaluations of reservoir water-tightness. Sealed piezometers are now almost universally used to measure water pressure within the mass. The location of these piezometers must be decided immediately upon completion of each borehole. A common aid to making this decision is a plot of borehole depth and borehole water level as functions of time. This paper introduced another way to evaluate the same data, with the borehole water depth plotted as a function of borehole depth. Anomalies can be detected more easily, and piezometers installed within these zones. Examples were given. (Visocky - ISWS)

ANALYTIC SOLUTIONS FOR DETERMINING NATURALLY FRACTURED RESERVOIR PROPERTIES BY WELL TESTING,
Instituto Mexicano del Petroleo, Mexico City.
A. O. de Swaan.
Society of Petroleum Engineers Journal, Vol. 16, No. 3, p 117-122, June 1976. 3 fig, 1 tab, 10 ref, append.

Descriptors: *Mathematical models, *Fracture permeability, *Oil reservoirs, *Compressible flow, Equations, Pressure, Drawdown, Hydraulic properties, Porosity, Flow, Graphical methods, Diffusivity, Porous media.
Identifiers: *Matrix blocks, Well testing.

A completely unsteady-state theory was developed that described the well pressure response of infinite, naturally fractured reservoirs of the type composed by high-permeability fractures and tight matrix blocks. The theory exclusively involved flow properties and dimensions of the fractures and the matrix blocks; no extra adjusting parameters were needed for predicting the pressure response of a reservoir with known properties. Comparison of computed pressure-drawdown theoretical curves with results of a numerical model applied to idealized reservoirs showed a good fit. It was concluded that an evaluation of the following reservoir properties is possible from well-test pressure plots: the fractures' kh product and the average product of the matrix porosity by a characteristic dimension of the matrix blocks. Thus, the model allowed comparison of well-test pressure response with the formation measurements. (Visocky - ISWS)

Identifiers: *Bayes theorem, *Decision theo *Uncertainty principle, Systems engineeri Probability theory.

Economic and sociopolitical aspects of land re mation in areas that necessitate drainage are co bined with technical problems to yield a set possible decisions, among which an optim design is chosen. The loss or objective functio the sum of the expected damage caused by submersion of given crops resulting from extre rainfall events, and the initial cost of the recla tion. When the parameter uncertainty in the pro bility distribution function of extreme event taken into account in the loss function, a Ba risk function is obtained. The Bayes decis theoretic (BDT) approach consists of seekin decision that minimizes the Bayes risk funct The BDT also evaluates the decision taken compares the expected cost of delaying the c struction to the worth of additional informa resulting from such a delay. The practical exam of an intensive agricultural system with diffe types of soils and crops illustrates the method gy. Crop loss functions and probability distr tions of events are assumed on the basis of emp cal observations. (Bell-Cornell)

TIDE-POWERED ELECTRICAL GENERATOR,
F. V. Rusby.
U. S. Patent No. 3,959,663, 4 p, 3 fig, 7 ref; Official Gazette of the United States Patent Office, Vol 946, No 4, p 1886, May 25, 1976.

Descriptors: *Patents, *Energy conversion, Energy transfer, *Tidal energy, *Tidal water, Tidal powerplants, Engineering structures, Electric powerplants, Generators, Storage.
Identifiers: Jack bars, Weights.

A tide-powered electrical generator is described in which the energy from successive rising tides is stored in the form of potential energy for selective conversion to electricity. A float is constrained to vertical motion and it raises on successive tides a weight by means of a jack bar to reach a maximum predetermined height on a stable support structure where the weight is supported until release for the generation of electricity. Provision is made for the prevention of damage to the generator by excessive tidal rises. (Sinha - OEIS)

Identifiers: *Pavements, Pavement drainage.

This study was aimed at evaluating the performance of pavement drainage systems in Illinois constructed with locally available aggregate sources. The study was limited to investigating the use of open-graded, hot-mixed bituminous aggregate mixtures in pavement drainage systems. A preliminary investigation was carried out in the laboratory to evaluate the permeability and the stability of the open-graded bituminous aggregate mixtures. Specimens were prepared according to the procedures in ASTM D1559. Permeability tests (in which a constant-head test that allowed the measurement of permeability at low heads was used) and stability tests were performed on the same specimen. From the results of the preliminary investigations, six test pavements incorporating different design concepts were tested at the University of Illinois test track. Dynamic loading was applied to the test pavements, and water was passed through the open-graded bituminous aggregate drainage layers to simulate surface and lateral infiltration. Permeability tests at a constant head were carried out regularly on the pavement test sections. The progress of rutting in the test pavements was also recorded. Results of these limited tests indicated that open-graded bituminous aggregate mixtures possess a high order of permeability and that care must be taken to prevent the migration of subgrade fines into these aggregate layers if satisfactory drainage is to be achieved. This paper discussed methods that can be used to ensure satisfactory performance of pavements made of open-graded aggregates. (See also W76-12451) (Sims-ISWS)

Available from the National Technical Information Service, Springfield, VA 22161 as PB-257 560, $4.50 in paper copy, $3.00 in microfiche. Completion Report, (1975). 48 p, 2 tab, 6 ref, 4 append. OWRT A-031-ARIZ(2). 14-31-0001-5003.

Descriptors: *Data processing, *Data storage and retrieval, *Hydrologic data, Information retrieval, *Systems analysis, *Arizona, Information exchange, Water quality, Water supply, Groundwater, Watersheds(Basins), Data collections.
Identifiers: *Arizona Water Information System.

The Arizona Water Information System (AWIS) was developed for storage and retrieval of water resources data and for dissemination of water resources information pertaining to the State of Ariz. Collectively, the AWIS system contains a number of distinct elements. The Activity File is a listing of water resource activities and projects dating from 1961, which can be accessed by keywords or by agency to retrieve abstracts and information on approximately 1,000 projects; the file recently was updated and additional projects covered in a regional program pertaining to the Lower Colo. River Basin portions of Ariz., Calif., and Nev. A bimonthly Ariz. Water Resources News Bulletin and a companion Project Information Bulletin were initiated under this project and will be continued as a cooperative effort of the Ariz. Water Commission and the Univ. of Ariz. Water Resources Research Center and Office of Arid Lands Studies. A cassette-tape pilot series on Ariz. water trends also was produced and evaluated for use potential, which appears favorable. A western state conference on water information dissemination, sponsored by this project and the Office of Water Research and Technology, was held in Phoenix in 1973, to discuss the above kinds of activities in the several states and the possibilities for cooperative regional activities. The capacity for interactive hydrologic data processing, utilizing the DEC-10 computer system at the Univ. of Ariz., was developed in 1974 with the support of the Ariz. Water Commission (AWC). Groundwater and quality-of-water data furnished by AWC have been stored progressively in the system, and are retrievable by remote terminal through telephone hookup, by quarter-township grid location or by drainage basin.

Oxygen Activated-Sludge Systems--I., Technical Review of the Use of Oxygen in the Treatment of Waste Water,
W76-12668 5D

UK Work on the Use of Oxygen in the Treatment of Waste Water, Associated with the CCMS Advanced Waste Water Treatment Project, (II).
W76-12669 5D

Development in the Application of Oxygen in the Activated-Sludge Process in the Federal Republic of Germany, (III).
W76-12670 5D

Activated Sludge, (Literature Review),
W76-12675 5D

ADSORPTION
Fundamental Studies on Residue and Movement of Forestry Herbicides in Soil, (In Japanese),
W76-12263 5B

Oil Adsorbent,
W76-12409 5G

Adsorbent Material for Purifying Industrial Effluents by Precipitating Basic Nitrogenous Polymer on Support Using Activated Mineral Clay.
W76-12426 5D

Analytical Solution of the Equation for Transport of Reactive Solutes Through Soils,
W76-12450 2G

Effluent Treatment Process (Abwasseraufbereitungsverfahren),
W76-12506 5D

Process for Purifying Industrial Effluents (Verfahren zur Reinigung von industriellen Abwaessern),
W76-12507 5D

Waste Water Treatment -- A New Concept (Epuration D'Eaux Residuaires -- Nouvelle Conception).
W76-12617 5D

Wastewater Treatment - Physical and Chemical Methods, (Literature Review),
W76-12629 5D

Influence of Activated Sludge CRT on Adsorption.
W76-12636 5D

Physicochemical Wastewater Treatment Methods, (In Greek),
W76-12655 5D

Anthracite Activated Carbons: Manufacture and Applications,
W76-12658 5D

AERATED LAGOONS
The Effect of Methods of Operation of Aeration Basins on the Development and Population Density of Culex Pipiens L. in the South of the Russian SFSR, (In Russian),
W76-12419 5G

Aerobic Lagoon Waste Treatment and Method,
W76-12499 5D

AERATION
Some Causes of Anomalies in Oxygen Mass Transfer in Polluted Water, (In Russian),
W76-12265 5D

Device for Aerating Water Bodies, (In Russian),
W76-12311 5G

Albuquerque Plant Designed with Computer in Mind,
W76-12638 5D

AERATORS
Some Causes of Anomalies in Oxygen Mass Transfer in Polluted Water, (In Russian),
W76-12265 5D

AERIAL INFRARED PHOTOGRAPHY
Remote Sensing of Mississippi River Characteristics,
W76-12442 7B

AERIAL PHOTOGRAPHY
Remote Sensing of Mississippi River Characteristics,
W76-12442 7B

AEROBIC CONDITIONS
Dissolved Oxygen Probe,
W76-12391 5D

AEROBIC TREATMENT
WLJ Previews First Commercial Manure System,
W76-12361 5D

Thermophilic Aerobic Microbiological Treatment of High Strength Wastewaters and Recovery of Protein,
W76-12623 5D

Oxygen Activated-Sludge Systems--I., Technical Review of the Use of Oxygen in the Treatment of Waste Water,
W76-12668 5D

AEROSOLS
The Chemistry of 700 Years of Precipitation at Dye 3, Greenland,
W76-12181 5A

AFRICA
Water Balance in Uganda,
W76-12204 2A

AGGREGATE PLANTS
$10-Million Aggregate Plant Recycles Process Water,
W76-12414 5D

AGITATION LEACHING
Utilization of Clear Water Sewage Effluent in Mineral Processing,
W76-12464 5D

AGRICULTURAL INSTRUCTION
Relating Agricultural Instruction to Environment Improvement: The Role of Land and Soil,
W76-12354 5G

AGRICULTURAL RUNOFF
Low-Cost Disposal Systems for Feedlot Runoff,
W76-12346 5G

Keeping Runoff Safe.
W76-12351 5G

You Have to 'Think Maintenance' in Managing Feedlot Runoff Systems,
W76-12360 5D

Management of Runoff Water in Relation to Feedlot Operations,
W76-12365 5D

Soil Conservation Service Standard and Specifications for Pollution Abatement Measures for Confined Livestock or Poultry Feeding Operations,
W76-12367 5G

Guidelines for Handling Liquid Waste from Feedlots,
W76-12368 5G

Sampling and Calculation Methods for Determining Quantities of Nitrogen and Phosphorus in Watershed Runoff,
W76-12372 5A

AGRICULTURAL WATERSHEDS
Water Yield Model Using SCS Curve Numbers,
W76-12522 2A

AGRICULTURE
Role of Agriculture in the Quality of the New Hampshire Environment,
W76-12337 5G

AIR BUBBLES
Bubble Tube: Apparatus for Determining Rate of Collection of Bacteria by Air Bubble Rising in Water,
W76-12492 5A

AIR POLLUTION
The Chemistry of 700 Years of Precipitation at Dye 3, Greenland,
W76-12181 5A

Automatic Determination of Sulfates by an Improved Nephelometric Method: Application to the Determination of SO2 in Atmospheric Air and of Sulfates in Rain Water, (In French),
W76-12259 5A

Beef Feedlots - A Pollution Problem,
W76-12358 5G

ALABAMA
Estimating Groundwater Evapotranspiration from Streamflow Records,
W76-12285 2D

ALASKA
Ice Thickness Observations, North American Arctic and Subarctic, 1970-71, 1971-72,
W76-12182 2C

Thermal Analysis of Frozen Embankment Islands,
W76-12200 2L

Comparison of Ecological Impacts of Postulated Oil Spills at Selected Alaskan Locations. Volume I. Introduction, Summary, Methodology, Evaluation and Appendices,
W76-12379 5C

Some Remarks on the Unusual Beaufort Sea Ice Conditions in Summer 1975,
W76-12470 2C

ALBEDO
Remote Sensing or Snowpack Density Using Shortwave Radiation,
W76-12167 2C

ALGAE
Studies on the Algal Colonization of the Saale River Near Jena: Part I. The Test Area and its Non-Biological Properties, (In German),
W76-12166 5A

Specific Features of Phytoplankton in the Lower Course of the Irtysh River, (In Russian),
W76-12267 5C

ALGAL COLONIZATION
Studies on the Algal Colonization of the Saale River Near Jena: Part I. The Test Area and its Non-Biological Properties, (In German),
W76-12166 5A

ALGAL CONTROL
A Limnological Study of Spiritwood Lake, N. D., With Special Emphasis on Its Water Quality, Seasonal Cycles of Chemical Nutrients Phytoplankton, Zooplankton and Primary Production, Part II: Causes and Control of Algal Blooms in Spiritwood Lake, North Dakota,
W76-12214 5C

ALKALIS (BASES)
Method for Sludge Treatment,
W76-12410 5D

ALPINE DENUDATION
A Uniform Measure of Subaerial Erosion,
W76-12191 2J

ALTERNATIVE COSTS
Economic Costs of Controlling Water Quality Through Management of Irrigation Return Flows,
W76-12218 5G

ALTERNATIVE PLANNING
Evaluating Tisza River Basin Development Plans Using Multiattribute Utility Theory,
W76-12534 4A

Use of Investment Models for the Long-Term Planning of a Water Resource System for England and Wales,
W76-12557 6A

ALUM
Reproducibility Evaluation of the Flocculation of a Synthetic Latex Colloidal System,
W76-12212 5D

ALUM (ALUMINUM SULFATE) RECOVERY
Alum Recovery and Waste Disposal in Water Treatment,
W76-12399 5F

ALUMINUM
Determination of Aluminum in Paper Machine White Water by Potentiometric Titration with Fluoride Ion,
W76-12482 5A

ALUMINUM SULFATE
Improvements to Processes for Purifying Effluents Originating from the Manufacture and Bleaching of Chemical or Semichemical Paper-making Pulps (Perfectionnement aux procedes d'epuration des effluents provenant de la fabrication et du blanchiment des pates a papier dites chimiques ou semi-chimiques),
W76-12498 5D

Process for Treatment of Paper Pulp-Containing Effluents (Verfahren zur Behandlung von papierbreihaltigen Abfallfluessigkeiten),
W76-12501 5D

AMBERLITE ION EXCHANGE RESINS
Removal and Recovery of Phenols from Industrial Waste Effluents with Amberlite XAD Polymeric Adsorbents,
W76-12487 5D

AMMONIA
Toxicity of Ammonia, Nitrite Ion, Nitrate Ion, and Orthophosphate to Mercenaria Mercenaria and Crassostrea Virginica,
W76-12237 5C

The Linkage between Chemical Pollution and Bacteriological Pollution in Coastal Zones (Recherche D'Une Liaison Entre La Pollution Chimique et la Pollution Bacteriologique Dans Les Zones Littorales),
W76-12590 5B

Ammonia Removal from Wastewater by Ligand Exchange,
W76-12611 5D

AMMONIUM COMPOUNDS
Acute Toxicity of Phos-Check (Trade Name) 202 and Diammonium Phosphate to Fathead Minnows,
W76-12334 5C

AMPEROMETRIC TITRATION
Determination of Chlorine Dioxide and Other Active Chlorine Compounds in Aqueous Solutions (Oznaczanie dwutlenku chloru oraz innych aktywnych zwiazkow chloru wroztworach wodnych),
W76-12510 5A

ANAEROBIC BACTERIA
Anaerobic Processes, (Literature Review),
W76-12673 5D

ANAEROBIC CONDITIONS
Anaerobic Processes, (Literature Review),
W76-12673 5D

ANAEROBIC DIGESTION
Photosynthetic Reclamation of Agricultural Solid and Liquid Wastes,
W76-12349 5D

Practical Aspects of Anaerobic Digestion,
W76-12648 5D

Anaerobic Processes, (Literature Review),
W76-12673 5D

ANAEROBIC LAGOONS
Evaluating a Low-Energy, High-Volume Pump for Odor Reduction from Livestock Waste Lagoons by Mixing,
W76-12344 5G

ANAEROBIOSIS
Degradation of DDT in an Everglades Muck as Affected by Lime, Ferrous Iron and Anaerobiosis,
W76-12254 5B

LIBRARY OF THE URBANA-CHAMPAIGN

NALYSIS
An Orthogonalized Convolution Method of Tide Prediction,
W76-12192 2L

NALYTICAL TECHNIQUES
Radar Derived Spatial Statistics of Summer Rain - Data Reduction and Analysis,
W76-12179 7B

Preliminary Studies of Asbestiform Fibers in Domestic Water Supplies,
W76-12325 5A

Analytical Three-Dimensional Transient Modeling of Effluent Discharges,
W76-12433 5B

Analytical Solution of the Equation for Transport of Reactive Solutes Through Soils,
W76-12450 2G

Determination of Chlorine Dioxide and Other Active Chlorine Compounds in Aqueous Solutions (Oznaczanie dwutlenku chloru oraz innych aktywnych zwiazkow chloru wroztworach wodnych),
W76-12510 5A

Nitrogen Availability in Urban Runoff,
W76-12596 5B

A New Approach to the Design of Filtration Systems,
W76-12642 5D

Nitrifying Organism Concentration and Activity,
W76-12647 5D

NIMAL BEHAVIOR
Sub-Lethal Effects of Chlorinated Hydrocarbons on Bivalves,
W76-12177 5C

NIMAL PARASITES
Schistosomiasis and Other Human Parasitoses of Lake Lindu in Central Sulawesi (Celebes), Indonesia,
W76-12573 5C

ION EXCHANGE
Process for Separating Cellulose from Waste Water (Verfahren zur Befreiung von Zellulose aus Abwaessern),
W76-12502 5D

ISOTROPY
Interpretation of in Situ Permeability Tests on Anisotropic Deposits,
W76-12455 2G

UACULTURE
A Review of Literature on the Use of Potassium Permanganate (KMn04) in Fisheries,
W76-12335 5C

UATIC ENVIRONMENT
Documentation of Selected Constructs and Parameter Values in the Aquatic Model Leaner,
W76-12519 5C

UATIC INSECTS
Studies on the Productivity of the Kalen-Go-Stream in Central Africa, (In German),
W76-12324 5C

Use of Emergence Data for Estimating Annual Production of Aquatic Insects,
W76-12597 2I

AQUATIC WEED CONTROL
Response of Water-Hyacinth to Laser Radiation,
W76-12406 4A

AQUEDUCTS
Optimization of Design Capacity of an Aqueduct,
W76-12526 4A

AQUIFER CHARACTERISTICS
The Shallow Aquifer--A Prime Freshwater Resource in Eastern Palm Beach County, Florida,
W76-12278 2F

Availability of Ground Water Near Carmel, Hamilton and Marion Counties, Indiana,
W76-12287 6A

Ground-Water Resources in the Lompoc Area Santa Barbara County, California,
W76-12288 2F

Preliminary Analysis of Geohydrologic Data from Test Wells Drilled Near Chalk Point, Prince Georges County, Maryland,
W76-12289 4B

Geology and Water Resources of Brown County, South Dakota--Part II: Water Resources,
W76-12290 4A

A Note on Computing Finite Difference Interblock Transmissivities,
W76-12292 2F

Ground-Water Resources of Lane and Scott Counties, Western Kansas,
W76-12298 4B

Maps Showing Ground-Water Conditions in the Harquahala Plains Area, Maricopa and Yuma Counties, Arizona--1975,
W76-12299 7C

AQUIFER TESTING
A Slug Test for Determining Hydraulic Conductivity of Unconfined Aquifers with Completely or Partially Penetrating Wells,
W76-12432 2F

AQUIFERS
A Note on Computing Finite Difference Interblock Transmissivities,
W76-12292 2F

Recent Advances in Artificial Recharge,
W76-12295 4B

A Slug Test for Determining Hydraulic Conductivity of Unconfined Aquifers with Completely or Partially Penetrating Wells,
W76-12432 2F

ARCTIC
Ice Thickness Observations, North American Arctic and Subarctic, 1970-71, 1971-72,
W76-12182 2C

Metabolic Rates of Arctic Lakes,
W76-12602 5C

ARCTIC LAKES
Metabolic Rates of Arctic Lakes,
W76-12602 5C

ARIZONA
Continuation of the Arizona Water Information System (AWIS),
W76-12216 10D

Maps Showing Ground-Water Conditions in the Harquahala Plains Area, Maricopa and Yuma Counties, Arizona--1975,
W76-12299 7C

Windbreaks May Increase Water Yield from the Grassland Islands in Arizona's Mixed Conifer Forests,
W76-12477 3B

ARIZONA WATER INFORMATION SYSTEM
Continuation of the Arizona Water Information System (AWIS),
W76-12216 10D

ARTESIAN AQUIFERS
Unsteady Flow to a Nonpenetrating Artesian Well,
W76-12445 2F

ARTIFICIAL RECHARGE
Recent Advances in Artificial Recharge,
W76-12295 4B

ASBESTIFORM FIBERS
Preliminary Studies of Asbestiform Fibers in Domestic Water Supplies,
W76-12325 5A

ASBESTOS
Preliminary Studies of Asbestiform Fibers in Domestic Water Supplies,
W76-12325 5A

ASSESSMENT
Quantitative Assessment of Environmental Impact,
W76-12528 6G

ATLANTA (GA)
Flood Plain Information: Yellow River, Part III, Metropolitan Atlanta, Georgia.
W76-12595 4A

ATLANTIC OIL
Hydrocarbon Residues in Ivory Coast Waters,
W76-12579 5C

ATLANTIC SALMON
An Acute Septicaemic Disease of Brown Trout (Salmo Trutta) and Atlantic Salmon (Salmo Salar) Caused by a Pasteurella-Like Organism,
W76-12332 5C

ATMOSPHERE
Study of the Lower Stratospheric Thermal Structure and Total Ozone from Nimbus-4 IRIS,
W76-12184 2B

Atmospheric Structure and Variability in Areas of Convective Storms Determined from 3-h Rawinsonde Data,
W76-12185 2B

The Operation of a Simplex Activated Sludge Pilot Plant in an Atmosphere of Pure Oxygen, Part 2,
W76-12665 5D

ATOMIC ABSORPTION SPECTROPHOTOMETRY
Lead Nitrate Poisoning in the Carp (Cyprinus Carpio L.):Localization of the Pollutant in the Body, (In French),
W76-12251 5A

Trace Metals and Pollution of the Belgian Coast and of the Schelt Estuary, (In French),
W76-12260 5A

ATP DETERMINATION
An Inexpensive Sampler for Studying the Microbiology of River Mud,
W76-12599 5A

ATTITUDES
The Winooski Workshops: An Assessment of Specified Workshop Techniques for Stimulating and Improving Public Involvement in Water Resources,
W76-12151 6B

AUTOMATION
The Use of Computer Techniques and Automation for Water Resources Systems.
W76-12535 6A

Present Situation and Trends in the Application of Advanced Methods and Techniques for Water Resources Management.
W76-12536 7C

AVAILABLE WATER
Water Availability of Monroe County, Alabama,
W76-12281 4A

AZOTOBACTER
Microbiological Characterization of the Lacustrine Deposit Laid Open by Drying up of the Greaca Lake, (In Romanian),
W76-12571 2J

BACTERIA
Isolation of Parasitic and Saprophytic Strains of Bdellovibrio Bacteriovorus from Natural Waters, (In Russian),
W76-12262 5A

Quantity of Heterotrophic Bacteria on Some Higher Plants in Carp Ponds, (In Russian),
W76-12271 5B

Distribution of Heterotrophic Bacteria in Water and Bottom Deposits of the Kremenchug Reservoir in Relation to the Intensity of Development of Blue-Green Algae, (In Russian),
W76-12306 5C

A New Standard 'Drinking Water' (Gost 2874-73) and Its Scientific Basis, (In Russian),
W76-12317 5G

The Use of Diatoms and Bacteria as Biological Indicators of Pollution in Streams, (In Portugese),
W76-12318 5A

Bacterioplankton Reproduction in Phials with Filtered Water, (In Russian),
W76-12319 5C

An Acute Septicaemic Disease of Brown Trout (Salmo Trutta) and Atlantic Salmon (Salmo Salar) Caused by a Pasteurella-Like Organism,
W76-12332 5C

Bubble Tube: Apparatus for Determining Rate of Collection of Bacteria by Air Bubble Rising in Water,
W76-12492 5A

Microbiological Characterization of the Lacustrine Deposit Laid Open by Drying up of the Greaca Lake, (In Romanian),
W76-12571 2J

The Linkage between Chemical Pollution and Bacteriological Pollution in Coastal Zones. (Recherche D'Une Liaison Entre La Pollution Chimique et la Pollution Bacteriologique Dans Les Zones Littorales),
W76-12590 5B

Concentrations of Nitrifying Bacteria in Sewages, Effluents, and a Receiving Stream and Resistance of These Organisms to Chlorination,
W76-12654 5D

BACTERIOLOGICAL ANALYSIS
The Linkage between Chemical Pollution and Bacteriological Pollution in Coastal Zones. (Recherche D'Une Liaison Entre La Pollution Chimique et la Pollution Bacteriologique Dans Les Zones Littorales),
W76-12590 5B

BACTERIOPLANKTON
Bacterioplankton Reproduction in Phials with Filtered Water, (In Russian),
W76-12319 5C

BADEN-WURTTEMBERG (GERMANY)
Performance Comparison Survey of the Public Sewage-Treatment Plants in Baden-Wuerttemberg 1975 (Leistungsvergleich Fuer Klaeranlagen 1975 in Baden-Wuerttemberg),
W76-12618 5D

BAHAMA ISLANDS
Environmental Analysis for Bahamas Supertanker Port,
W76-12222 5G

BALTIC SEA
Sea Level Computations of the Baltic with a 20-Canal Model,
W76-12205 2L

BANK STABILIZATION
A Study of the Effects of Stream Channelization and Bank Stabilization on Warmwater Sport Fish in Iowa: Subproject No. 3 Some Effects of Short-Reach Channelization on Fish and Fish Food Organisms, in Central Iowa Warm Water Stream,
W76-12232 4C

A Study of the Effects of Stream Channelization and Bank Stabilization on Warmwater Sport Fish in Iowa: Subproject 2. A Study of the Impact of Selected Bank Stabilization Structures on Game Fish and Associated Organisms,
W76-12233 4C

A Study of the Effects of Stream Channelization and Bank Stabilization on Warm Water Sport Fish in Iowa: Subproject I Inventory of Major Stream Alterations in Iowa,
W76-12234 4C

Warm Water Stream Alteration in Iowa: Extent, Effects on Habitat, Fish, and Fish Food, and Evaluation of Stream Improvement Structures (Summary Report),
W76-12235 4C

BARRIERS
An In-Situ Investigation of Oil Barrier Shape and Drag Coefficients,
W76-12378 5G

High Seas Oil Containment Barrier Mooring System,
W76-12384 5G

BARTER ISLAND (ALASKA)
Thermal Analysis of Frozen Embankment Islands,
W76-12200 2L

BASELINE STUDIES
Proposed Cross-Florida Barge Canal Water Quality Aspects, with a Section on Waste-Assimilative Capacity,
W76-12283 5C

BASIC DATA COLLECTIONS
Guide to the Availability of Hydrologic Data Greater Pittsburgh Region, Pennsylvania.
W76-12282 7C

Water-Level Changes in Southwestern Kansas 1940-75,
W76-12297 4

BASIC EXTRACTIVE SLUDGE TREATMENT
Alum Sludge Drying with Basic Extractive Treatment,
W76-12641 5

BASIN COMPUTATIONS
Plot-Derived Parameters for Basin Computations,
W76-12438 2

BASINS
Plot-Derived Parameters for Basin Computations,
W76-12438 2

BAY OF CADIZ (SPAIN)
Hydrography and Phytoplankton from the Bay of Cadiz, from January of 1970 to December 1973, (In Spanish),
W76-12309 5

The Mercury Concentration in Eels (Anguilla Anguilla) from the Estuary of the Guadalquivir River and 'Esteros' of Salines of Cadiz Bay (In Spanish),
W76-12321 5

BAYES THEOREM
Bayesian Approach to Tile Drain Design,
W76-12527 5

BDELLOVIBRIO-BACTERIOVORUS
Isolation of Parasitic and Saprophytic Strains of Bdellovibrio Bacteriovorus from Natural Waters, (In Russian),
W76-12262

BEACH PROFILES
Sand Level Changes on Torrey Pines Beach, California,
W76-12383

BEACHES
Basic Remote Sensing Investigations for Beach Reconnaissance: An Interim Report,
W76-12375

Sand Level Changes on Torrey Pines Beach, California,
W76-12383

BEAUFORT SEA (ALAS)
Some Remarks on the Unusual Beaufort Sea Ice Conditions in Summer 1975,
W76-12470

BELT SEA
Sea Level Computations of the Baltic with 20-Canal Model,
W76-12205

BENTHIC FLORA
Effects of a Waste of 'Paper Kraft' on Benthic Algal Populations in N.W. Spain 'Stress' on the Fucaceae Standing Crop, Spanish),
W76-12327

LIBRARY U. OF I. URBANA-CHAMPAIGN

BENTHIC ORGANISMS
Sub-Lethal Effects of Chlorinated Hydrocarbons on Bivalves,
W76-12177 5C

BENTHOS
Hydrocarbon Residues in Ivory Coast Waters,
W76-12579 5C

A Counterstaining Technique for Use in Sorting Benthic Samples,
W76-12606 2I

BENZO (A)PYRENE RELEASE
Release of the Carcinogen Benzo(a) Pyrene from Environmentally Contaminated Mussels,
W76-12328 5B

BIBLIOGRAPHIES

A Contribution to Stabilization Ponds Design, (In Greek),
W76-12656 5D

Recent Developments in Sewage Treatment and Equipment,
W76-12662 5D

Lagoons and Oxidation Ponds, (Literature Review),
W76-12671 5D

Anaerobic Processes, (Literature Review),
W76-12673 5D

Biological Filters, (Literature Review),
W76-12674 5D

BIOMASS
Seston of the Kiev Water Reservoir and Quantitative Ratios of Its Components, (In Russian),
W76-12302 5C

Hydrography and Phytoplankton from the Bay of Cadiz, from January of 1970 to December of 1973, (In Spanish),
W76-12309 5A

BIRDS
Studies on Oil Pollution and Seabirds in Denmark 1968-1971,
W76-12256 5C

BLACK LIQUORS
Process for Treating Waste Waters from Alkaline Pulping (Procedes de traitement des eaux residuelles de fabrication des pates de cellulose par des methodes alcalines),
W76-12497 5D

On the Mechanism of Gamma-Radiolysis of Effluents (K mekhanizmu gamma-radioliza stochnykh vod),
W76-12508 5D

BLACK SEA
Development of Certain Black Sea Fishes in Sea Contaminated by Petroleum Products,
W76-12326 5C

BLACKLICK CREEK (OH)
Flood Hazard Information: Backlick Creek, Violet Township, Fairfield County, Ohio.
W76-12592 4A

BLEACHING WASTES
Phenolic and Chlorophenolic Oligomers in Chlorinated Pine Kraft Pulp and in Bleach Plant Effluents,
W76-12475 5D

First Closed-Cycle Kraft Mill,
W76-12488 5D

Method for Treating Hemi Caustic Effluents,
W76-12495 5D

Improvements to Processes for Purifying Effluents Originating from the Manufacture and Bleaching of Chemical or Semichemical Papermaking Pulps (Perfectionnement aux procedes d'epuration des effluents provenant de la fabrication et du blanchiment des pates a papier dites chimiques ou semi-chimiques),
W76-12498 5D

Process for Separating Cellulose from Waste Water (Verfahren zur Befreiung von Zellulose aus Abwaessern),
W76-12502 5D

BOARD MILLS
Container Corp. Boxboard Plant Installs Clarification, Sludge Recycling System.
W76-12491 5D

BOGS
Peat Temperature Regime of a Minnesota Bog and the Effect of Canopy Removal,
W76-12174 2G

BOREHOLES
The Depth VS. Depth Plot: an Aid to Selecting Piezometer Installation Depths in Boreholes,
W76-12447 8B

BORON
Determination of Boron in Drinking Water from Koszalin Province, (In Polish),
W76-12261 5A

BOTTOM SEDIMENTS
Distribution of Trace Elements in Bottom Sediments of the Kiev Reservoir Ukrainia SSR, USSR, (In Russian),
W76-12305 5B

An Historical Perspective of Nutrient Inputs and Trophic States as Deduced from Cayuga Lake Sediments,
W76-12463 5C

BOTTOM TOPOGRAPHY
Basic Remote Sensing Investigations for Beach Reconnaissance: An Interim Report,
W76-12375 2L

Mesoscale Component of the Geostrophic Flow and its Temporal and Spatial Variability in the California Current off Monterey Bay in 1973-74,
W76-12387 2L

BRANCH-AND-BOUND METHODS
The Solution of the Regionalization Problem by Certain Branch-and-Bound Methods,
W76-12552 5D

BRAZIL
The Use of Diatoms and Bacteria as Biological Indicators of Pollution in Streams, (In Portugese),
W76-12318 5A

Phosphorus Deficiency in Cattle from the Brasilia Region of Brazil, (In Portugese),
W76-12322 5G

BROWN TROUT
An Acute Septicaemic Disease of Brown Trout (Salmo Trutta) and Atlantic Salmon (Salmo Salar) Caused by a Pasteurella-Like Organism,
W76-12332 5C

BUBBLES
Flotation: Two Fresh Ways to Treat Effluents,
W76-12661 5D

BURNING
Hydrologic Impact of Burning and Grazing on a Chained Pinyon-Juniper Site in Southeastern Utah,
W76-12153 4C

BYPRODUCTS
Chemicals and Allied Products (Literature Reviews),
W76-12412 5D

Apparatus and Process for Producing an Organic Product from Sewage Sludge,
W76-12600 5D

Process for Treating Decomposable Organic Waste Materials,
W76-12601 5D

CADMIUM
The Effects of Cadmium on Freshwater Phytoplankton,
W76-12152 5C

Acute Efects of Cadmium on Ictalurus Punctatus (Catfish),
W76-12331 5C

CALIFORNIA
Major Floods, Poor Land Use Delay Return of Sedimentation to Normal Rates
W76-12157 4D

Central Sierra Profiling Snow Gage: A Guide to Fabrication and Operation.
W76-12158 2C

Development of a Radioactive Isotope Profiling Snow Gage,
W76-12159 2C

Seasonal Snow Surface Energy Balance in a Forest Opening,
W76-12160 2C

O18/O16 Abundance Variations in Sierra Nevada Seasonal Snowpacks and Their Use in Hydrological Research,
W76-12169 2C

Supercritical Flow at Open-Channel Junctions; Hydraulic Model Investigation,
W76-12187 8B

Sediment Discharge from Highway Cut-Slopes in the Lake Tahoe Basin, California, 1972-74,
W76-12279 4C

Ground-Water Resources in the Lompoc Area Santa Barbara County, California,
W76-12288 2F

Sand Level Changes on Torrey Pines Beach, California,
W76-12383 2L

Mesoscale Spatial and Temporal Variations of Water Mass Characteristics in the California Current Region off Monterey Bay in 1973-1974,
W76-12386 2L

Mesoscale Component of the Geostrophic Flow and its Temporal and Spatial Variability in the California Current off Monterey Bay in 1973-74,
W76-12387 2L

A High Sierra Precipitation Measurement Program, Final Report on the 1975 Season,
W76-12446 2B

Professional Requirements of Modern Water Engineers Involved in River Basin Management Utilizing Contemporary Tools,
W76-12537 4A

Flood Plain Information: Freshwater Creek Humboldt County, California.
W76-12593 4A

CALIFORNIA CENTRAL VALLEY PROJECT
Optimization of Real Time Daily Operation of Multiple Reservoir System,
W76-12155 4A

CALIFORNIA CURRENT SYSTEM
Mesoscale Spatial and Temporal Variations of Water Mass Characteristics in the California Current Region off Monterey Bay in 1973-1974,
W76-12386 2L

CANADA
Ice Thickness Observations, North America, Arctic and Subarctic, 1970-71, 1971-72,
W76-12182 2C

Population Dynamics of Cladocerans in Sunfish Lake, Ontario,
W76-12407 2H

CASEBOOK U. OF I. URBANA-CHAMPAIGN

Field Determination of the Densities of Lake Ice Sheets,
W76-12429 2C

A Dynamic Regional Model for Evaluating Resource Development Programs,
W76-12520 4A

A Legal-Historical Analysis of Navigation User Charges,
W76-12532 6E

Report of the Qu'Appelle Basin Study Board.
W76-12587 5G

Metabolic Rates of Arctic Lakes,
W76-12602 5C

Recent Developments in Sewage Treatment and Equipment,
W76-12662 5D

CANAL CONSTRUCTION
Proposed Cross-Florida Barge Canal: Water-Quality Aspects, with a Section on Waste-Assimilative Capacity,
W76-12283 5G

CAPROLACTAM
Sanitary-Chemical Investigation of the Migration of the Monomer from Caprolon into Water, (In Russian),
W76-12316 5B

CAPROLON
Sanitary-Chemical Investigation of the Migration of the Monomer from Caprolon into Water, (In Russian),
W76-12316 5B

CARBOHYDRATES
Method for Treating Hemi Caustic Effluents,
W76-12495 5D

CARBON
Carbon Contents of Surface and Underground Waters in South-Central Minnesota,
W76-12202 5A

CARBONATE SATUROMETRY
An Improved in Situ pH Sensor for Oceanographic and Limnological Applications,
W76-12479 7B

CARDIAC MONITORING
Principle of a Technical Device for the Study of Toxic Effluents in Water Pollution, (In French),
W76-12255 5A

CARP
Lead Nitrate Poisoning in the Carp (Cyprinus Carpio L.):Localization of the Pollutant in the Body, (In French),
W76-12251 5A

Quantity of Heterotrophic Bacteria on Some Higher Plants in Carp Ponds, (In Russian),
W76-12271 5B

The Influence of Grass-Carp Population (Ctenopharyngodon Idella Val.) on the Vegetation and Ecosystem of Lake Trakoscan, (In Serbo-Croatian),
W76-12272 5C

Seasonal Dynamics of the Periphytic Macrofauna in Carp Ponds in South-West Bohemia,
W76-12395 2H

CASTELLON COAST (SPAIN)
Hydrography and Phytoplankton of the Coast of Castellon, from September 1969 to January 1971, (In Spanish),
W76-12164 5A

CATALYSTS
The Use of Fluid Catalytic Cracking Catalyst in Activated Sludge Wastewater Treatment,
W76-12646 5D

CATFISHES
Acute Efects of Cadmium on Ictalurus Punctatus (Catfish),
W76-12331 5C

CATIONS
Dissolved Nutrient Losses in Storm Runoff from Five Southern Pine Watersheds,
W76-12172 5B

CATTLE
Phosphorus Deficiency in Cattle from the Brasilia Region of Brazil, (In Portugese),
W76-12322 5G

Role of Agriculture in the Quality of the New Hampshire Environment,
W76-12337 5G

The Renovation and Reuse of Water for Dilution and Hydraulic Transport of Dairy Cattle Manure,
W76-12345 5D

Factors Affecting Quality and Quantity of Feedlot Waste Collections,
W76-12364 5D

CAYUGA LAKE (NY)
An Historical Perspective of Nutrient Inputs and Trophic States as Deduced from Cayuga Lake Sediments,
W76-12463 5C

CELL RESIDENCE TIME
Influence of Activated Sludge CRT on Adsorption.
W76-12636 5D

CELLULOSE
Method for Treating Hemi Caustic Effluents,
W76-12495 5D

Process for Separating Cellulose from Waste Water (Verfahren zur Befreiung von Zellulose aus Abwaessern),
W76-12502 5D

Process for Purifying Industrial Effluents (Verfahren zur Reinigung von industriellen Abwaessern),
W76-12507 5D

CENTRIFUGATION
Process for Purifying Papermaking Effluents (Verfahren zur Reinigung von bei der Papierherstellung anfallendem Abwasser),
W76-12505 5D

CESIUM RADIOISOTOPES
Effects of Temperature and Salinity on Growth and Uptake of 65ZN and 137CS for Six Marine Algae,
W76-12238 5C

CHALK POINT (MARYLAND)
Preliminary Analysis of Geohydrologic Data from Test Wells Drilled Near Chalk Point, Prince Georges County, Maryland,
W76-12289 4B

CHANNEL DIMENSIONS
Discharge Prediction, Present and Former, from Channel Dimensions,
W76-12198 2E

CHANNEL FLOW
Discharge Prediction, Present and Former, from Channel Dimensions,
W76-12198 2E

CHANNEL IMPROVEMENT
Warm Water Stream Alteration in Iowa: Extent, Effects on Habitat, Fish, and Fish Food, and Evaluation of Stream Improvement Structures (Summary Report),
W76-12235 4C

CHANNEL MORPHOLOGY
A Study of the Effects of Stream Channelization and Bank Stabilization on Warmwater Sport Fish in Iowa: Subproject 4: The Effects of Longreach Channelization on Habitat and Invertebrate in Some Iowa Streams,
W76-12231 4C

A Study of the Effects of Stream Channelization and Bank Stabilization on Warmwater Sport Fish in Iowa: Subproject 2. A Study of the Impact of Selected Bank Stabilization Structures on Game Fish and Associated Organisms,
W76-12233 4C

CHANNELING
A Study of the Effects of Stream Channelization and Bank Stabilization on Warmwater Sport Fish in Iowa: Subproject 5: Effects of Long-Reach Stream Channelization on Distribution and Abundance of Fishes,
W76-12230 4C

A Study of the Effects of Stream Channelization and Bank Stabilization on Warmwater Sport Fish in Iowa: Subproject 4: The Effects of Longreach Channelization on Habitat and Invertebrate in Some Iowa Streams,
W76-12231 4C

A Study of the Effects of Stream Channelization and Bank Stabilization on Warmwater Sport Fish in Iowa: Subproject No. 3 Some Effects of Short-Reach Channelization on Fish and Fish Food Organisms, in Central Iowa Warm Water Stream,
W76-12232 4C

A Study of the Effects of Stream Channelization and Bank Stabilization on Warm Water Sport Fish in Iowa: Subproject I Inventory of Major Stream Alterations in Iowa,
W76-12234 4C

Warm Water Stream Alteration in Iowa: Extent, Effects on Habitat, Fish, and Fish Food, and Evaluation of Stream Improvement Structures (Summary Report),
W76-12235 4C

CHANNELS
Discharge Prediction, Present and Former, from Channel Dimensions,
W76-12198 2E

Increasing the Mean Current in Coastal Channels,
W76-12201 2L

CHEMICAL ANALYSIS
The Chemistry of 700 Years of Precipitation at Dye 3, Greenland,
W76-12181 5A

CHEMICAL DEGRADATION
Chemical and Microbiological Degradation of Malathion and Parathion in an Estuarine Environment,
W76-12437 5B

CHEMICAL INDUSTRY
Chemicals and Allied Products (Literature Reviews),
W76-12412 5D

Purifying Waste Liquor - From E. G. Sodium Carbonate Production, Ammonia Regeneration, Brine Purification, etc.,
W76-12413 5D

CHEMICAL OXYGEN DEMAND
Transport Rate of Cod Through a Wet Porous Stratum - Measurement of Diffusivity in Cattle Manure Solution,
W76-12352 5B

Coagulation of Textile Waste Water,
W76-12420 5D

Kinetics and Process Control of Nitrification in Completely Mixed Biological Wastewater Treatment,
W76-12620 5D

Influence of Activated Sludge CRT on Adsorption.
W76-12636 5D

Performance of Single Household Treatment Units,
W76-12637 5D

CHEMICAL PRECIPITATION
Time Parameter Evaluation in Dual Flocculant Destabilization,
W76-12211 5D

Reproducibility Evaluation of the Flocculation of a Synthetic Latex Colloidal System,
W76-12212 5D

Process for Treating Waste Waters from Alkaline Pulping (Procedes de traitement des eaux residuelles de fabrication des pates de cellulose par des methodes alcalines),
W76-12497 5D

Improvements to Processes for Purifying Effluents Originating from the Manufacture and Bleaching of Chemical or Semichemical Papermaking Pulps (Perfectionnement aux procedes d'epuration des effluents provenant de la fabrication et du blanchiment des pates a papier dites chimiques ou semi-chimiques),
W76-12498 5D

Process for Treatment of Paper Pulp-Containing Effluents (Verfahren zur Behandlung von papierbreihaltigen Abfallfluessigkeiten),
W76-12501 5D

Process for Precleaning Industrial Waste Water Resulting from the Processing of Water-Soluble Phenolic Resins or Urea-Formaldehyde Resin Solutions (Verfahren zur Vorreinigung von bei der Verarbeitung von wasserloeslichen phenolischen Resolen oder von Harnstoff-Formaldehydharzloesungen anfallendem Industrieabwasser),
W76-12504 5D

Recovery of P205 from Waste-Waters by Adding Lime (Sekkai Shori Ni Yoru Haisuichu No P2O5 No Kaishu),
W76-12660 5D

CHEMICAL REACTIONS
Nitrogen Availability in Urban Runoff,
W76-12596 5B

CHEMICAL TREATMENT
Apparatus for Biological and Chemical Purification of Water by Agglomeration,
W76-12401 5F

Second Attempt to Treat Anglia's Toxic Wastes,
W76-12632 5D

Optimize the Effluent System - Part 4: Approach to Chemical Treatment,
W76-12667 5D

CHEMICAL WASTES
Use of Infrared Spectroscopy for Determining Environmental Pollutants, (In Russian),
W76-12307 5A

Decontamination of Water Containing Lipophilic Substances.
W76-12341 5D

Hygienic Evaluation of Potatoes Grown in Soil Irrigated with Effluents from Coking and Chemical Plants of the Donets Coal Basin, (In Russian),
W76-12369 5C

Method for Sludge Treatment,
W76-12410 5D

Chemicals and Allied Products (Literature Reviews),
W76-12412 5D

New Beamhouse Development to Simplify Tannery Waste Water Management,
W76-12427 5D

Recovery of P205 from Waste-Waters by Adding Lime (Sekkai Shori Ni Yoru Haisuichu No P2O5 No Kaishu),
W76-12660 5D

CHESAPEAKE BAY
Growth and Dissipation of Phytoplankton in Chesapeake Bay: I. Response to a Large Pulse of Rainfall,
W76-12572 5C

CHLAMYDOMONAS
Effects of Temperature and Salinity on Growth and Uptake of 65ZN and 137CS for Six Marine Algae,
W76-12238 5C

CHLORAMINE
Determination of Chlorine Dioxide and Other Active Chlorine Compounds in Aqueous Solutions (Oznaczanie dwutlenku chloru oraz innych aktywnych zwiazkow chloru wroztworach wodnych),
W76-12510 5A

CHLORINATED HYDROCARBON PESTICIDES
Sub-Lethal Effects of Chlorinated Hydrocarbons on Bivalves,
W76-12177 5C

CHLORINATION
Phenolic and Chlorophenolic Oligomers in Chlorinated Pine Kraft Pulp and in Bleach Plant Effluents,
W76-12475 5D

Concentrations of Nitrifying Bacteria in Sewages, Effluents, and a Receiving Stream and Resistance of These Organisms
Chlorination,
W76-12654 5

CHLORINE COMPOUNDS
Determination of Chlorine Dioxide and Oth
Active Chlorine Compounds in Aqueous Sol
tions (Oznaczanie dwutlenku chloru oraz
nych aktywnych zwiazkow chloru wroztwora
wodnych),
W76-12510 5

CHLORINE DIOXIDE
Determination of Chlorine Dioxide and Oth
Active Chlorine Compounds in Aqueous So
tions (Oznaczanie dwutlenku chloru oraz
nych aktywnych zwiazkow chloru wroztwora
wodnych),
W76-12510

CHLORITES
Determination of Chlorine Dioxide and Oth
Active Chlorine Compounds in Aqueous So
tions (Oznaczanie dwutlenku chloru oraz
nych aktywnych zwiazkow chloru wroztwora
wodnych),
W76-12510

CHROMATOGRAPHY
Color Characterization of Kraft Linerboa
Decker Effluent,
W76-12472

The Chromatographic Method of Determin
Inorganic and Organic Mercury Compounds
Fresh Water, (In Russian),
W76-12569

CIRCULAR CYLINDERS
Interaction of Water Waves with Cylinder B
rier,
W76-12441

Wave Forces on Vertical Circular Cylinder,
W76-12443

CITIES
Wastewater Treatment Facility, Paris Uti
District,
W76-12639

CLAMS
Sub-Lethal Effects of Chlorinated Hydroc
bons on Bivalves,
W76-12177

Toxicity of Ammonia, Nitrite Ion, Nitrate I
and Orthophosphate to Mercenaria Mercen
and Crassostrea Virginica,
W76-12237

CLARKS CREEK (NC)
Clarks Creek Flood Plain Study, Catav
County, North Carolina.
W76-12582

CLAY MINERALS
Mineralogy and Related Parameters of Flu
Suspended Sediments in Northwestern Ohio
W76-12203

CLIMATES
Water Balance in Uganda,
W76-12204

CLIMATOLOGY
Peat Temperature Regime of a Minnesota
and the Effect of Canopy Removal,
W76-12174

CLOUD PHYSICS
Atmospheric Structure and Variability in Areas of Convective Storms Determined from 3-h Rawinsonde Data,
W76-12185 2B

COAGULANTS
Reproducibility Evaluation of the Flocculation of a Synthetic Latex Colloidal System,
W76-12212 5D

COAGULATION
Reproducibility Evaluation of the Flocculation of a Synthetic Latex Colloidal System,
W76-12212 5D

Coagulation of Textile Waste Water,
W76-12420 5D

Process for Treating Waste Waters from Alkaline Pulping (Procedes de traitement des eaux residuelles de fabrication des pates de cellulose par des methodes alcalines),
W76-12497 5D

Wastewater Treatment - Physical and Chemical Methods, (Literature Review),

Options of Development and Integrated Management of Water Resources,
W76-12538 6B

Benefit Cost Analysis--A Necessary Part of Environmental Decisioning,
W76-12576 6G

COST EFFECTIVENESS
Planning the Location and Capacity of Flood Control Structures,
W76-12156 4A

COST MINIMIZATION
Cost Functions for Wastewater Conveyance Systems,
W76-12513 5D

Dynamic Programming for Determination of a Storm Water Outlet System of Pipes and Flood-Damping Dams,
W76-12542 4A

COST TRENDS
Average Rise of EPA Plant, Sewer Indexes Slows.
W76-12598 5D

COSTS
Low-Cost Disposal Systems for Feedlot Runoff,
W76-12346 5G

Economic Evaluation of Liquid Manure Disposal Systems for Dairy Cattle,
W76-12357 5G

Cost Functions for Wastewater Conveyance Systems,
W76-12513 5D

Sewage Plant Upgrades Effluent.
W76-12613 5D

COTTON
Sanitary Evaluation of the Conditions of Soil Decontamination of Wastewaters of Hydrolysis Plants of the Uzbek SSR, (In Russian),
W76-12257 5D

CRICOTOPUS-SYLVESTRIS
Seasonal Dynamics of the Periphytic Macrofauna in Carp Ponds in South-West Bohemia,
W76-12395 2H

CROSS-FLORIDA BARGE CANAL
Proposed Cross-Florida Barge Canal: Water Quality Aspects, with a Section on Waste-Assimilative Capacity,
W76-12283 5C

CRUSTACEANS
Effects of Copper on Survival and Osmoregulation in Marine and Brackish Water Isopods (Crustacea),
W76-12333 5C

Population Dynamics of Cladocerans in Sunfish Lake, Ontario,
W76-12407 2H

CRYOBIOLOGY
On Hydrobiology: Critical Misapprehensions Concerning the Discipline, (In Hungarian),
W76-12269 2A

CRYSTAL RIVER (FLA)
Further Thermal Addition Studies at Crystal River, Florida with an Annotated Checklist of Marine Fishes Collected 1969-1971,
W76-12163 5C

CTENOPHORE
An Alternate Grazing Hypothesis for the Patuxent Estuary,
W76-12396 2L

CULEX-PIPIENS
The Effect of Methods of Operation of Aeration Basins on the Development and Population Density of Culex Pipiens L. in the South of the Russian SFSR, (In Russian),
W76-12419 5G

CUMANA (VENEZUELA)
Some Observations on the Contamination of the Coastal Waters of the City of Cumana, (In Spanish),
W76-12467 5B

CURRENTS (WATER)
Increasing the Mean Current in Coastal Channels,
W76-12201 2L

Sea Level Computations of the Baltic with a 20-Canal Model,
W76-12205 2L

Mesoscale Spatial and Temporal Variations of Water Mass Characteristics in the California Current Region off Monterey Bay in 1973-1974,
W76-12386 2L

Mesoscale Component of the Geostrophic Flow and its Temporal and Spatial Variability in the California Current off Monterey Bay in 1973-74,
W76-12387 2L

Influence of Surface Waves on Subsurface Current Measurements in Shallow Water,
W76-12431 2L

LIBRARY OF THE UNIVERSITY OF ILLINOIS AT URBANA-CHAMPAIGN

CYANOPHYTA
Specific Features of Phytoplankton in the Lower Course of the Irtysh River, (In Russian),
W76-12267 5C

Distribution of Heterotrophic Bacteria in Water and Bottom Deposits of the Kremenchug Reservoir in Relation to the Intensity of Development of Blue-Green Algae, (In Russian),
W76-12306 5C

Device for Aerating Water Bodies, (In Russian),
W76-12311 5G

CYCLING NUTRIENTS
Dissolved Nutrient Losses in Storm Runoff from Five Southern Pine Watersheds,
W76-12436 5B

Microbiological Transformation of Carbon Nitrogen, Sulfur, Iron, Phosphorus and Calcium Compounds in Lake Reservoirs, (In Polish),
W76-12494 5C

CZECHOSLOVAKIA (BOHEMIA)
Seasonal Dynamics of the Periphytic Macrofauna in Carp Ponds in South-West Bohemia,
W76-12395 2H

DAIRY INDUSTRY
The Renovation and Reuse of Water for Dilution and Hydraulic Transport of Dairy Cattle Manure,
W76-12345 5D

Economic Evaluation of Liquid Manure Disposal Systems for Dairy Cattle,
W76-12357 5G

DAMS
Structural Model Studies for the Hendrik Verwoerd Dam,
W76-12523 8A

Application of Dynamic Programming in Framing Operating Rules for a Multi-Purpose Dam,
W76-12541 4A

DANUBE RIVER
Several Water Chemistry Data on the Knowledge of the Section of the Danube between Budapest and Turnu Severin (1645-1040 km) (Danubialia Hungarica LXVII), (In German),
W76-12574 5A

DAPHNIA
Population Dynamics of Cladocerans in Sunfish Lake, Ontario,
W76-12407 2H

DARCYS LAW
On the General Equations for Flow in Porous Media and Their Reduction to Darcy's Law,
W76-12199 2F

DATA BASES
Implementation of a Large Scale Water Quality Data Management System,
W76-12521 5G

DATA COLLECTIONS
Shadow Length Tables for Latitude 42 Degrees North,
W76-12242 4A

Shadow Length Tables for Latitude 50 Degrees North,
W76-12243 4A

Shadow Length Tables for Latitude 44 Degrees North,
W76-12244 4A

Shadow Length Tables for Latitude 46 Degrees North,
W76-12245 4A

Shadow Length Tables for Latitude 48 Degrees North,
W76-12246 4A

Shadow Length Tables for Latitude 38 Degrees North,
W76-12247 4A

Shadow Length Tables for Latitude 40 Degrees North,
W76-12248 4A

Shadow Length Tables for Latitude 36 Degrees North,
W76-12249 4A

Developing A State Water Plan: Ground-Water Conditions in Utah, Spring of 1976,
W76-12296 4B

Implementation of a Large Scale Water Quality Data Management System,
W76-12521 5G

DATA PROCESSING
Radar Derived Spatial Statistics of Summer Rain - Experiment Description,
W76-12178 7B

Radar Derived Spatial Statistics of Summer Rain - Data Reduction and Analysis,
W76-12179 7B

Radar Derived Spatial Statistics of Summer Rain - Appendices.
W76-12180 7B

A Study of the Utilization of ERTS-1 Data from the Wabash River Basin,
W76-12183 7B

Continuation of the Arizona Water Information System (AWIS),
W76-12216 10D

Fast Current Oil Response Systems, Tests on Phase I Concepts,
W76-12385 5G

River System Modelling for Operational Forecasting,
W76-12550 4A

Computer Application in Processing Technical and Economic Data for Optimizing Complex Water Resources Systems,
W76-12565 6A

DATA STORAGE AND RETRIEVAL
Continuation of the Arizona Water Information System (AWIS),
W76-12216 10D

Implementation of a Large Scale Water Quality Data Management System,
W76-12521 5G

DAVIS BAYOU (MISS)
Chemical and Microbiological Degradation of Malathion and Parathion in an Estuarine Environment,
W76-12437 5B

DDD
Degradation of DDT in an Everglades Muck as Affected by Lime, Ferrous Iron and Anaerobiosis,
W76-12254 5B

DDT
Sub-Lethal Effects of Chlorinated Hydrocarbons on Bivalves,
W76-12177 5C

Degradation of DDT in an Everglades Muck as Affected by Lime, Ferrous Iron and Anaerobiosis,
W76-12254 5B

DDT Causes Changes in Activity and Schooling Behavior in Goldfish,
W76-12330 5C

DEBRIS BASIN
You Have to 'Think Maintenance' in Managing Feedlot Runoff Systems,
W76-12360 5D

DECISION MAKING
Optimization of Real Time Daily Operation of a Multiple Reservoir System,
W76-12155 4A

Allowance for the Stochastic Character of Hydrological Data in Water Project Decisions,
W76-12439 7A

Bayesian Approach to Tile Drain Design,
W76-12527 8B

Evaluating Tisza River Basin Development Plans Using Multiattribute Utility Theory,
W76-12534 4A

Simplified Decision Model for National Water Supply Development,
W76-12564 6A

Development of Residuals Management Strategies,
W76-12581 5G

DECISION THEORY
Bayesian Approach to Tile Drain Design,
W76-12527 8B

DECKERS (PULP THICKENERS)
Color Characterization of Kraft Linerboard Decker Effluent,
W76-12472 5A

DECOLORING
Process for Purifying Industrial Effluents (Verfahren zur Reinigung von industriellen Abwaessern),
W76-12507 5D

DECOMPOSING ORGANIC MATTER
Destruction of Organic Matter in Grounds of Kapchagai Reservoir, (In Russian),
W76-12320 5C

Process for Treating Decomposable Organic Waste Materials,
W76-12601 5D

DEEP WATER
On Phillips' Theory of Equilibrium Range in the Spectra of Wind-Generated Gravity Waves,
W76-12326 2H

DEEP WELLS
Outlooks for the Future of Deep Well Disposal,
W76-12370 5E

DEEPWATER PORTS
Predicted Oil Slick Movement from Various Locations Off the New Jersey-Delaware Coastline,
W76-12376 5B

DEFIBRATION
Wood Fiber Boards: Raw Materials, Defibrating Conditions, Waste Water (Trefiberplater rastoff -- defibreringsbetingelser -- avlopsvann),
W76-12476 5B

DEFORMATION
Effect of Seepage on Embankment Deformations Due to Water Loading,
W76-12188 4A

DEGRADATION (DECOMPOSITION)
Degradation of DDT in an Everglades Muck as Affected by Lime, Ferrous Iron and Anaerobiosis,
W76-12254 5B

DELAWARE
Predicted Oil Slick Movement from Various Locations Off the New Jersey-Delaware Coastline,
W76-12376 5B

DEMINERALIZATION
Reverse Osmosis System with Automatic Flushing,
W76-12402 5D

DENITRIFICATION
Animal Waste and Nitrate Movement Through Soil,
W76-12362 5B

Improvements in and Relating to Waste Water Treatment,
W76-12603 5D

Nitrate Reduction in Peat,
W76-12625 5D

DENMARK
Studies on Oil Pollution and Seabirds in Denmark 1968-1971,
W76-12256 5C

DENSITY
Field Determination of the Densities of Lake Ice Sheets,
W76-12429 2C

DEPTH
The Depth VS. Depth Plot: an Aid to Selecting Piezometer Installation Depths in Boreholes,
W76-12447 8B

DESALINATION
1973-1974 Saline Water Conversion Summary Report.
W76-12343 3A

DESALINATION PROCESSES
Hygienic Evaluation of Electrodialysis Water Desalination Set Up, (In Russian),
W76-12394 5D

DESIGN
Several Hydrobiological Problems of Ground Water Storage in Metropolitan Water Works (Budapest): I, (In German),
W76-12258 5F

Economic Uncertainties in Water Resources Project Design,
W76-12514 6A

Use of Simulation Models for the Evaluation of a Regional Water-Resource System,
W76-12540 6A

Wastewater Reclamation and Re-Use: The Responsibilities of the Consulting Engineer,
W76-12622 5D

A New Approach to the Design of Filtration Systems,
W76-12642 5D

DESIGN CRITERIA
Sprinkler Irrigation Design Criteria for Sugar Beets,
W76-12374 3F

Mass Transfer Limitations on Trickling Filter Design,
W76-12608 5D

Coleshill (1): Experimenting with Waste Water Treatment,
W76-12609 5D

Design of Integrated Approach to Nutrient Removal,
W76-12635 5D

A Contribution to Stabilization Ponds Design, (In Greek),
W76-12656 5D

DETERGENTS
The Linkage between Chemical Pollution and Bacteriological Pollution in Coastal Zones. (Recherche D'Une Liaison Entre La Pollution Chimique et la Pollution Bacteriologique Dans Les Zones Littorales),
W76-12590 5B

DETRITUS
Several Hydrobiological Problems of Ground Water Storage in Metropolitan Water Works (Budapest): I, (In German),
W76-12258 5F

Vertical Distribution, Sestonic Seasonal Dynamice and the Role of Detritus in the Lake Dal'neye Ecosystem, (In Russian),
W76-12301 5C

DEVELOPING COUNTRIES
The Application of Mathematical Models and Optimization Techniques in Planning Water Supply and Waste Water Disposal Systems,
W76-12560 6A

DEWATERING
Some Waste Treatment Problems in the Hide and Leather Industries,
W76-12424 5D

Apparatus, Installation, and Process for Dewatering Clarified Sludges (Vorrichtung, Anordnung und Verfahren zur Entwaesserung von Klaerschlaemmen),
W76-12503 5D

Coleshill (2): Incinerating Sewage Sludge,
W76-12610 5E

DIATOMS
Succession of Plankton Diatoms in Tokyo Bay, (In Japanese),
W76-12268 5C

Seston of the Kiev Water Reservoir and Quantitative Ratios of Its Components, (In Russian),
W76-12302 5C

The Use of Diatoms and Bacteria as Biological Indicators of Pollution in Streams, (In Portuguese),
W76-12318 5

DICYANDIAMIDE-FORMALDEHYDE RESINS
Process for Treatment of Paper Pulp-Containing Effluents (Verfahren zur Behandlung von papierbreihaltigen Abfallfluessigkeiten),
W76-12501 5

DIELDRIN
Sub-Lethal Effects of Chlorinated Hydrocarbons on Bivalves,
W76-12177 5

DIELECTRIC CONSTANT
Capacitance Sensor for Soil Moisture Measurement,
W76-12457 2

DIFFUSIVITY
Transport Rate of Cod Through a Wet Porous Stratum - Measurement of Diffusivity in Cattle Manure Solution,
W76-12352 5

DIGESTION
The Passage of Tritium with Drinking Water into the Body of Rats and Their Progeny in a Chronic Experiment, (In Russian),
W76-12392 5

Digestion of Aqueous Wastes with Oxygen Pressure-Recycling Oxidation Sewage Treatment,
W76-12663 5

DIGITAL COMPUTERS
Plot-Derived Parameters for Basin Computations,
W76-12438

DINOFLAGELLATES
A Red Bloom in Horn So near Lemvig (N. Jutland), Caused by the Dinoflagellate Oxyrrhis Marina, (In Danish),
W76-12264

Succession of Plankton Diatoms in Tokyo Bay, (In Japanese),
W76-12268

DIPTERA
Seasonal Dynamics of the Periphyton Macrofauna in Carp Ponds in South-West Bohemia,
W76-12395

DISCHARGE PREDICTION
Discharge Prediction, Present and Form from Channel Dimensions,
W76-12198

DISCHARGE (WATER)
Discharge Prediction, Present and Form from Channel Dimensions,
W76-12198

DISINFECTION
Hygienic Evaluation of Electrodialysis Water Desalination Set Up, (In Russian),
W76-12394

Recent Developments in Sewage Treatment and Equipment,
W76-12662

DISPERSION
Coaslescence Filter For Oil-Water Dispersion
W76-12408

UNIVERSITY OF ILLINOIS URBANA-CHAMPAIGN

An Analysis of the Numerical Solution of the Transport Equation,
W76-12434 5B

Determination of Dispersive Clay Soil Erodibility by Using a Physical Test,
W76-12460 2G

Mixing and Transport, (Literature Review),
W76-12672 5B

ISPERSIVE CLAY SOILS
Determination of Dispersive Clay Soil Erodibility by Using a Physical Test,
W76-12460 2G

ISPOSAL PROCEDURE
Evaluation of Proposed Sewage Sludge Dumpsite Areas in the New York Bight.
W76-12469 5E

ISSOLVED OXYGEN
The Influence of Grass-Carp Population (Ctenopharyngodon Idella Val.) on the Vegetation and Ecosystem of Lake Trakoscan, (In Serbo-Croatian),
W76-12272 5C

A Stochastic Model for Predicting the Probability Distribution of the Dissolved-Oxygen Deficit in Streams,
W76-12276 5B

A Summary of Receiving Water Dissolved Oxygen Conditions below Pulp and Paper Mill Locations,
W76-12480 5B

ISSOLVED OXYGEN PROBES
Dissolved Oxygen Probe,
W76-12391 5D

STRIBUTION
The Effect of Domestic Waste Water on the Distribution of Gammarus Pulex L. and Gammarus Fossarum Koch in a Sub-Alpine Mountain Stream in Hessen, (In German),
W76-12304 5C

Distribution of Trace Elements in Bottom Sediments of the Kiev Reservoir Ukrainia SSR, USSR, (In Russian),
W76-12305 5B

Distribution of Heterotrophic Bacteria in Water and Bottom Deposits of the Kremenchug Reservoir in Relation to the Intensity of Development of Blue-Green Algae, (In Russian),
W76-12306 5C

STRIBUTION PATTERNS
A Study of the Effects of Stream Channelization and Bank Stabilization on Warmwater Sport Fish in Iowa: Subproject 5: Effects of Long-Reach Stream Channelization on Distribution and Abundance of Fishes,
W76-12230 4C

On Phillips' Theory of Equilibrium Range in the Spectra of Wind-Generated Gravity Waves,
W76-12336 2H

TRICT OF COLUMBIA
Northeastern United States Water Supply Study, Interim Report, Critical Choices for Critical Years.
W76-12584 6D

MESTIC WASTES
The Effect of Domestic Waste Water on the Distribution of Gammarus Pulex L. and Gammarus Fossarum Koch in a Sub-Alpine Mountain Stream in Hessen, (In German),
W76-12304 5C

Performance of Single Household Treatment Units,
W76-12637 5D

DOMESTIC WATER
Preliminary Studies of Asbestiform Fibers in Domestic Water Supplies,
W76-12325 5A

DONETS COAL BASIN (USSR)
Hygienic Evaluation of Potatoes Grown in Soil Irrigated with Effluents from Coking and Chemical Plants of the Donets Coal Basin, (In Russian),
W76-12369 5C

DRAG
Interaction of Water Waves with Cylinder Barrier,
W76-12441 8B

Wave Forces on Vertical Circular Cylinder,
W76-12443 8B

DRAINAGE CODES (LAW)
Reform of Illinois Water Resource Laws with Particular Reference to the Drainage Code and Closely Related Laws,
W76-12217 6E

DRAWDOWN
Unsteady Flow to a Nonpenetrating Artesian Well,
W76-12445 2F

DREDGING
Environmental Implications of Maintenance and Improvement of the Gulf Intracoastal Waterway in Texas,
W76-12390 5G

DRIFT VELOCITIES
Mass Transport in Gravity Waves on a Sloping Bottom,
W76-12190 2L

DRYING
Alum Sludge Drying with Basic Extractive Treatment,
W76-12641 5E

DUCKS (WILD)
Studies on Oil Pollution and Seabirds in Denmark 1968-1971,
W76-12256 5C

DUMPSITES
Evaluation of Proposed Sewage Sludge Dumpsite Areas in the New York Bight.
W76-12469 5E

DYE-3 (GREENLAND)
The Chemistry of 700 Years of Precipitation at Dye 3, Greenland,
W76-12181 5A

DYE CONCENTRATION
Analytical Three-Dimensional Transient Modeling of Effluent Discharges,
W76-12433 5B

DYE RELEASES
Analytical Three-Dimensional Transient Modeling of Effluent Discharges,
W76-12433 5B

DYES
Zero Discharge as Exemplified by Textile Dyeing and Finishing,
W76-12421 5D

DYNAMIC PROGRAMMING
Optimization of Real Time Daily Operation of a Multiple Reservoir System,
W76-12155 4A

Dynamic Programming for Determination of a Storm Water Outlet System of Pipes and Flood-Damping Dams,
W76-12542 4A

E. COLI
The Linkage between Chemical Pollution and Bacteriological Pollution in Coastal Zones. (Recherche D'Une Liaison Entre La Pollution Chimique et la Pollution Bacteriologique Dans Les Zones Littorales),
W76-12590 5B

EARTH DAMS
Effect of Seepage on Embankment Deformations Due to Water Loading,
W76-12188 4A

EASTERN MASSACHUSETTS-RHODE ISLAND METROPOLITAN AREA
Northeastern United States Water Supply Study, Interim Report, Critical Choices for Critical Years.
W76-12584 6D

ECOLOGICAL DISTRIBUTION
A Red Bloom in Horn So near Lemvig (N. W. Jutland), Caused by the Dinoflagellate Oxyrhis Marina, (In Danish),
W76-12264 5C

ECOLOGICAL IMPACT
Comparison of Ecological Impacts of Postulated Oil Spills at Selected Alaskan Locations. Volume I. Introduction, Summary, Methodology, Evaluation and Appendices,
W76-12379 5C

ECOLOGY
Interdisciplinary Models of Water Systems,
W76-12516 6A

ECONOMIC IMPACT
Cost of Water Pollution Control in the Carpet Industry,
W76-12422 5G

ECONOMIC PRODUCTION FUNCTIONS
Application of Dynamic Programming in Framing Operating Rules for a Multi-Purpose Dam,
W76-12541 4A

ECONOMIC UNCERTAINTY PROGRAMMING
Economic Uncertainties in Water Resources Project Design,
W76-12514 6A

ECONOMICS
Economic Evaluation of Liquid Manure Disposal Systems for Dairy Cattle,
W76-12357 5G

Economic Uncertainties in Water Resources Project Design,
W76-12514 6A

Use of Investment Models and Choice of Alternative Decisions for the Optimum Distribution of Water Resources at the Stage of Planning by Means of Computers,
W76-12561 6A

UNIVERSITY OF ILLINOIS-URBANA-CHAMPAIGN

ECONOMICS

Optimal Development Programme for Regional Water Supply Systems,
W76-12563 6A

Computer Application in Processing Technical and Economic Data for Optimizing Complex Water Resources Systems,
W76-12565 6A

ECOSYSTEMS
Analysis of the Role of the Gulf Intracoastal Waterway in Texas,
W76-12389 5G

Environmental Implications of Maintenance and Improvement of the Gulf Intracoastal Waterway in Texas,
W76-12390 5G

A Eutrophication Model for a Lake,
W76-12515 5C

An Interdisciplinary Mathematical Model Applied to the Southern Bight of the North Sea,
W76-12518 5B

EDUCATION
Relating Agricultural Instruction to Environment Improvement: The Role of Land and Soil,
W76-12354 5G

EELS
A Red Bloom in Horn So near Lemvig (N. W. Jutland), Caused by the Dinoflagellate Oxyrhis Marina, (In Danish),
W76-12264 5C

On Environmental Factors of Eel Pools: I. Chemistry of the Water and Soil and Plankton in October 1965 and July 1966, (In Japanese),
W76-12275 5C

The Mercury Concentration in Eels (Anguilla Anguilla) from the Estuary of the Guadalquivir River and 'Esteros' of Salines of Cadiz Bay, (In Spanish),
W76-12321 5C

EFFLUENTS
Self-Monitoring Procedures: Basic Laboratory Skills (164.6) Student Reference Manual,
W76-12377 5A

Analytical Three-Dimensional Transient Modeling of Effluent Discharges,
W76-12433 5B

Sewage Plant Upgrades Effluent.
W76-12613 5D

Effluent Irrigation of Rye and Ryegrass,
W76-12644 5D

ELECTRIC POWER INDUSTRY
Wastewater Resources in North Central Texas,
W76-12652 5G

ELECTRICAL METHODS (MEASUREMENT)
Measurement of Snowpack Wetness,
W76-12162 2C

ELECTRODIALYSIS
Hygienic Evaluation of Electrodialysis Water Desalination Set Up, (In Russian),
W76-12394 5D

GALVESTON BAY (TEX)
Environmental Factors Influencing Isolation of Enteroviruses from Polluted Surface Waters,
W76-12171 5A

GAMMA RAYS
On the Mechanism of Gamma-Radiolysis of Effluents (K mekhanizmu gamma-radioliza stochnykh vod),
W76-12508 5D

GAMMARUS-FOSSARUM
The Effect of Domestic Waste Water on the Distribution of Gammarus Pulex L. and Gammarus Fossarum Koch in a Sub-Alpine Mountain Stream in Hessen, (In German),
W76-12304 5C

GAMMARUS-PULEX
The Effect of Domestic Waste Water on the Distribution of Gammarus Pulex L. and Gammarus Fossarum Koch in a Sub-Alpine Mountain Stream in Hessen, (In German),
W76-12304 5C

GAS CHROMATOGRAPHY
Gas-Liquid Chromatographic Determination of 3-Trifluoromethyl-4-Nitrophenol in Natural Waters,
W76-12486 5A

GASES
Winter Hydrochemical Conditions of Small Rivers in the Polesye of the Ukrainian SSR (The Pripyat Basin), (In Russian),
W76-12303 5C

Factors Affecting Quality and Quantity of Feedlot Waste Collections,
W76-12364 5D

GEOMORPHOLOGY
A Uniform Measure of Subaerial Erosion,
W76-12191 2J

GEORGIA
Multivariate Analysis of Georgia Coastal Plain Groundwaters,
W76-12466 2F

Flood Plain Information: Yellow River, Part III, Metropolitan Atlanta, Georgia.
W76-12595 4A

GEOSTROPHIC FLOW
Mesoscale Component of the Geostrophic Flow and its Temporal and Spatial Variability in the California Current off Monterey Bay in 1973-74,
W76-12387 2L

GEOTHERMAL STUDIES
Chemical Characteristics of the Major Thermal Springs of Montana,
W76-12293 2K

GERMANY
Versatile Filtration Unit (Vielseitig einsetzbare Filtrationsanlage).
W76-12485 5D

GILLIES LAKE (ONTARIO)
Field Determination of the Densities of Lake Ice Sheets,
W76-12429 2C

GLACIAL AQUIFERS
Ground-Water and Surface-Water Relationships in the Glacial Province of Northern Wisconsin - Snake Lake,
W76-12444 5G

GOAL HIERARCHY
Tasam, A Method for Setting Goals, Evaluating and Comparing Plans,
W76-12559 6A

GOLDFISH BEHAVIOR
DDT Causes Changes in Activity and Schooling Behavior in Goldfish,
W76-12330 5C

GOVERNMENTAL INTERRELATION
Multiple-Use Conflicts Between Fishermen and Other Users of the Ocean With a Consideration of a Possible Expanded Federal Role,
W76-12227 6G

GRAPHICAL METHODS
The Depth VS. Depth Plot: an Aid to Selecting Piezometer Installation Depths in Boreholes,
W76-12447 8B

GRASSES
Phosphorus Deficiency in Cattle from the Brasilia Region of Brazil, (In Portugese),
W76-12322 5G

Effluent Irrigation of Rye and Ryegrass,
W76-12644 5D

GRASSLANDS
Windbreaks May Increase Water Yield from the Grassland Islands in Arizona's Mixed Conifer Forests,
W76-12477 3B

GRAVELS
Water Supplies from Ulster Valley Gravels,
W76-12524 4B

GRAVITY WAVES
On Phillips' Theory of Equilibrium Range in the Spectra of Wind-Generated Gravity Waves,
W76-12336 2H

GRAZING
Hydrologic Impact of Burning and Grazing on a Chained Pinyon-Juniper Site in Southeastern Utah,
W76-12153 4C

GREACA LAKE (ROMANIA)
Microbiological Characterization of the Lacustrine Deposit Laid Open by Drying up of the Greaca Lake, (In Romanian),
W76-12571 2J

GREAT PLAINS
An Approach to Research Administration,
W76-12575 6B

GREEN'S FUNCTION
Analytical Three-Dimensional Transient Modeling of Effluent Discharges,
W76 12433 5B

GROUNDWATER
Groundwater Property Rights and Controversies in Montana,
W76-12154 6E

On the General Equations for Flow in Porous Media and Their Reduction to Darcy's Law,
W76-12199 2F

Water Availability of Monroe County, Alabama,
W76-12281 4A

Estimating Groundwater Evapotranspiration from Streamflow Records,
W76-12285 2D

Effect of Cattle Feedlot Wastes Upon Ground Water--A Commentary,
W76-12366 5B

Unsteady Flow to a Nonpenetrating Artesian Well,
W76-12445 2F

Multivariate Analysis of Georgia Coastal Plain Groundwaters,
W76-12466 2F

Water Supplies from Ulster Valley Gravels,
W76-12524 4B

Optimization of Groundwater Withdrawals with Regard to Technical and Hydrological Constraints,
W76-12544 4B

Surface Water and Ground Water Interaction Phenomena in Planning Models,
W76-12553 4B

Mixing and Transport, (Literature Review),
W76-12672 5B

GROUNDWATER MOVEMENT
Hydrodynamics of Groundwater Flow in a Fractured Formation,
W76-12207 2F

GROUNDWATER RECHARGE
Ground-Water Resources in the Lompoc Area Santa Barbara County, California,
W76-12288 2F

GROUNDWATER RESOURCES
Digital Model to Predict Effects of Pumping from the Arikaree Aquifer in the Dwyer Area, Southeastern Wyoming,
W76-12277 4B

The Shallow Aquifer--A Prime Freshwater Resource in Eastern Palm Beach County, Florida,
W76-12278 2F

Availability of Ground Water Near Carmel, Hamilton and Marion Counties, Indiana,
W76-12287 6A

Ground-Water Resources in the Lompoc Area Santa Barbara County, California,
W76-12288 2F

Preliminary Analysis of Geohydrologic Dat from Test Wells Drilled Near Chalk Point Prince Georges County, Maryland,
W76-12289 4

Developing A State Water Plan Ground-Wat Conditions in Utah, Spring of 1976,
W76-12296 4

Water-Level Changes in Southwestern Kansa 1940-75,
W76-12297 4

Ground-Water Resources of Lane and Sco Counties, Western Kansas,
W76-12298

Maps Showing Ground-Water Conditions in t Harquahala Plains Area, Maricopa and Yu Counties, Arizona--1975,
W76-12299

Integrated Mathematical Models Used Groundwater Resources Planning in Areas fluenced by Human Settlements,.
W76-12543

GROWTH RATE
Effects of Temperature and Salinity on Gro and Uptake of 65ZN and 137CS for Six Ma Algae,
W76-12238

GROWTH RATES
A Bioenergetics-Based Model for Pollutant cumulation by Fish. Simulation of PCB Methyl-Mercury Residue Levels in Ott River Yellow Perch (Perca Flavescens),
W76-12329

GROWTH STAGES
Effect of Lindane on Trout Fry (Salmo Iri Gibb.) Changes in Glycolytic Enzymes, French),
W76-12253

GUATEMALA
Organic Matter Losses from Four Waters in the Humid Tropics,
W76-12428

GULF INTRACOASTAL WATERWAY (TEX
Analysis of the Role of the Gulf Intraco Waterway in Texas,
W76-12389

Environmental Implications of Mainten and Improvement of the Gulf Intraco Waterway in Texas,
W76-12390

GULF OF MEXICO
Identification and Mapping of Fishing Ban the Outer Continental Shelf of the Gulf of ico,
W76-12228

GULF OF ST. LAWRENCE
Oxygen Isotope Studies on Sea Ice in the of St. Lawrence,
W76-12448

GYRES
Lake Ontario Circulation in November,
W76-12430

HABITATS
A Study of the Effects of Stream Chan tion and Bank Stabilization on Warm Sport Fish in Iowa: Subproject 4: The E of Longreach Channelization on Habita Invertebrate in Some Iowa Streams,
W76-12231

CHAMPAIGN CO. U.G.L. URBANA-CHAMPAIGN

Warm Water Stream Alteration in Iowa: Extent, Effects on Habitat, Fish, and Fish Food, and Evaluation of Stream Improvement Structures (Summary Report),
W76-12235 4C

ARQUAHALA PLAINS AREA (ARIZ)
Maps Showing Ground-Water Conditions in the Harquahala Plains Area, Maricopa and Yuma Counties, Arizona--1975,
W76-12299 7C

AWAII
An Orthogonalized Convolution Method of Tide Prediction,
W76-12192 2L

Multipurpose Computer for the Honolulu Board of Water Supply,
W76-12589 4B

ZARDS
Flood-Hazard Effects on Residential Property Values,
W76-12529 6G

AVY METAL HYDROXIDES
Method for Sludge Treatment,
W76-12410 5D

MATOLOGY
cute Efects of Cadmium on Ictalurus Punctatus (Catfish),
W76-12331 5C

MICELLULOSES
Method for Treating Hemi Caustic Effluents,
W76-12495 5D

RBICIDES
undamental Studies on Residue and Movement of Forestry Herbicides in Soil, (In Japanese),
W76-12263 5B

TEROTROPHIC BACTERIA
uantity of Heterotrophic Bacteria on Some gher Plants in Carp Ponds, (In Russian),
W76-12271 5B

stribution of Heterotrophic Bacteria in Water d Bottom Deposits of the Kremenchug servoir in Relation to the Intensity of velopment of Blue-Green Algae, (In Russn),
W76-12306 5C

HWAYS
ost, Moisture, and Erosion.
W76-12451 2G

vement Cracking in West Texas Due to eeze-Thaw Cycling,
W76-12452 2C

gineering Properties of Compacted Clay nditioned by Saturation and Freeze-Thaw cles,
W76-12453 2C

SIDE EROSION
Uniform Measure of Subaerial Erosion,
W76-12191 2J

DRY
undwater Property Rights and Controversy in Montana,
W76-12154 6E

ING PONDS
Have to 'Think Maintenance' in Managing llot Runoff Systems,
W76-12360 5D

HONOLULU (HI)
Multipurpose Computer for the Honolulu Board of Water Supply,
W76-12589 4B

HORN SO (DENMARK)
A Red Bloom in Horn So near Lemvig (N. W. Jutland), Caused by the Dinoflagellate Oxyrhis Marina, (In Danish),
W76-12264 5C

HUDSON RIVER
Analytical Three-Dimensional Transient Modeling of Effluent Discharges,
W76-12433 5B

HUMAN DISEASES
Endemic Fluorosis in Punjab: I. Skeletal Aspect,
W76-12500 5C

Schistosomiasis and Other Human Parasitoses of Lake Lindu in Central Sulawesi (Celebes), Indonesia,
W76-12573 5C

HUMIDITY
Organic Matter Losses from Four Watersheds in the Humid Tropics,
W76-12428 5B

HUNGARY
Optimal Development Programme for Regional Water Supply Systems,
W76-12563 6A

Simplified Decision Model for National Water Supply Development,
W76-12564 6A

HURRICANE CAMILLE (1969)
Impact of Hurricane Tidal Surges on Subsequent Land Use Changes and Water Resources Reallocation,
W76-12461 4A

HURRICANES
Impact of Hurricane Tidal Surges on Subsequent Land Use Changes and Water Resources Reallocation,
W76-12461 4A

HYDRAULIC CONDUCTIVITY
A Slug Test for Determining Hydraulic Conductivity of Unconfined Aquifers with Completely or Partially Penetrating Wells,
W76-12432 2F

HYDRAULIC MODELS
A Laboratory Evaluation of Trash Racks for Drop Inlets,
W76-12189 8B

HYDRAULIC STRUCTURES
A Laboratory Evaluation of Trash Racks for Drop Inlets,
W76-12189 8B

HYDRAULIC TRANSPORTATION
The Renovation and Reuse of Water for Dilution and Hydraulic Transport of Dairy Cattle Manure,
W76-12345 5D

HYDRAULICS
Mass Transport in Gravity Waves on a Sloping Bottom,
W76-12190 2L

Applicability of Unit Stream Power Equation,
W76-12193 2J

HYDROBIOLOGY
Several Hydrobiological Problems of Ground Water Storage in Metropolitan Water Works (Budapest): I, (In German),
W76-12258 5F

On Hydrobiology: Critical Misapprehensions Concerning the Discipline, (In Hungarian),
W76-12269 2A

HYDRODYNAMICS
Sea Level Computations of the Baltic with a 20-Canal Model,
W76-12205 2L

Hydrodynamics of Groundwater Flow in a Fractured Formation,
W76-12207 2F

Wave Forces on Vertical Circular Cylinder,
W76-12443 8B

HYDROGEN ION CONCENTRATION
An Improved in Situ pH Sensor for Oceanographic and Limnological Applications,
W76-12479 7B

HYDROGEN PEROXIDE
Bulking Control Made Easy - With Hydrogen Peroxide,
W76-12664 5D

HYDROGEOLOGY
Availability of Ground Water Near Carmel, Hamilton and Marion Counties, Indiana,
W76-12287 6A

A Note on Computing Finite Difference Interblock Transmissivities,
W76-12292 2F

HYDROGRAPH ANALYSIS
A Method of Finding the Family of Runhydrographs for Given Return Periods,
W76-12195 2E

HYDROGRAPHS
A Method of Finding the Family of Runhydrographs for Given Return Periods,
W76-12195 2E

HYDROGRAPHY
Hydrography and Phytoplankton of the Coast of Castellon, from September 1969 to January 1971, (In Spanish),
W76-12164 5A

Hydrography and Phytoplankton from the Bay of Cadiz, from January of 1970 to December of 1973, (In Spanish),
W76-12309 5A

HYDROLOGIC ASPECTS
Water Supplies from Ulster Valley Gravels,
W76-12524 4B

Simulation Model of the Quantitative and Qualitative Evolution of Water Resources at Different Points of a River-Basin (Orne),
W76-12555 4A

HYDROLOGIC DATA
Continuation of the Arizona Water Information System (AWIS),
W76-12216 10D

Guide to the Availability of Hydrologic Data, Greater Pittsburgh Region, Pennsylvania.
W76-12282 7C

Allowance for the Stochastic Character of Hydrological Data in Water Project Decisions,
W76-12439 7A

HYDROLOGIC INFORMATION STORAGE AND RETRIEVAL SYSTEM (HISARS)
Regional Simulation of Streamflow Data, W76-12250 2A

HYDROLOGY
River System Modelling for Operational Forecasting, W76-12550 4A

ICE
Ice Thickness Observations, North American Arctic and Subarctic, 1970-71, 1971-72, W76-12182 2C

Field Determination of the Densities of Lake Ice Sheets, W76-12429 2C

ICE CORES
The Chemistry of 700 Years of Precipitation at Dye 3, Greenland, W76-12181 5A

ICE COVER
Some Remarks on the Unusual Beaufort Sea Ice Conditions in Summer 1975, W76-12470 2C

ICE DENSITY
Field Determination of the Densities of Lake Ice Sheets, W76-12429 2C

ICE THICKNESS
Ice Thickness Observations, North American Arctic and Subarctic, 1970-71, 1971-72, W76-12182 2C

Some Remarks on the Unusual Beaufort Sea Ice Conditions in Summer 1975, W76-12470 2C

IDAHO
A Study of the Utilization of ERTS-1 Data from the Wabash River Basin, W76-12183 7B

Flood Hazard Analyses for Lower Marsh Creek (Including Selected Tributaries), Bannock County, Idaho. W76-12580 4A

ILLINOIS
A Study of the Utilization of ERTS-1 Data from the Wabash River Basin, W76-12183 7B

Fine-Scale Time Variations of Rainfall in Western Oregon, W76-12209 2B

Reform of Illinois Water Resource Laws with Particular Reference to the Drainage Code and Closely Related Laws, W76-12217 6E

Evaluation of Pavement Drainage Systems Made of Layers of Open-Graded Bituminous Aggregate Mixtures, W76-12456 8F

INCINERATION
Coleshill (2): Incinerating Sewage Sludge, W76-12610 5E

Compact Incinerator for Solid and Liquid Wastes. W76-12612 5E

INDIAN CREEK (ALA)
Estimating Groundwater Evapotranspiration from Streamflow Records, W76-12285 2D

INDIAN OCEAN
Water Balance in Uganda, W76-12204 2A

INDIANA
A Study of the Utilization of ERTS-1 Data from the Wabash River Basin, W76-12183 7B

Wabash River Systems Model - Terminal Report Phase I, W76-12220 4A

Availability of Ground Water Near Carmel, Hamilton and Marion Counties, Indiana, W76-12287 6A

INDUS RIVER BASIN (INDIA)
Satellite Snow Observations and Seasonal Streamflow Forecasts, W76-12468 2C

INDUSTRIAL PRODUCTION
Anthracite Activated Carbons: Manufacture and Applications, W76-12658 5D

INDUSTRIAL WASTES
Experience in Decontamination of Industrial Wastes and Treatment Plant Sediments in Leningrad, (In Russian), W76-12291 5D

Hygienic Evaluation of Certain Surface-Active Substances, Components of Effluents from Textile Industry Enterprises, (In Russian), W76-12314 5A

Wool Process Water Purification Plant. W76-12338 5D

Decontamination of Water Containing Lipophilic Substances. W76-12341 5D

Wool Process Water Purification Plant. W76-12342 5D

Quality of Potatoes Grown on Fields Irrigated with Wastewaters of Coal-Tar Chemical and Metallurgical Plants, (In Russian), W76-12355 5C

Hygienic Evaluation of Potatoes Grown in Soil Irrigated with Effluents from Coking and Chemical Plants of the Donets Coal Basin, (In Russian), W76-12369 5C

Methods for Removing Fluoborates from Aqueous Media, W76-12398 5D

Method for Treating Pulp-Containing Waste Liquors, W76-12404 5D

Method for Sludge Treatment, W76-12410 5D

Petroleum Processing Wastes, (Literature Reviews), W76-12415 5D

Controlling Surface Water Contamination at the Esso Refinery at Antwerp (De Bestrijding Van De Verontreiniging Van Het Oppervlaktewater in De Esso-Raffinaderij te Antwerpen), W76-12416 5D

Paper Making Waste-Water Purification - By Flocculating, Separating Fibres from Flocculate, Adding Filter Aid, and Filtering Suspension. W76-12418

Some Waste Treatment Problems in the H and Leather Industries, W76-12424

Adsorbent Material for Purifying Industrial fluents by Precipitating Basic Nitrogen Polymer on Support Using Activated Min Clay. W76-12426

New Beamhouse Development to Simp Tannery Waste Water Management, W76-12427

Some Observations on the Contaminatio the Coastal Waters of the City of Cumana Spanish), W76-12467

Water Pollution Control in the Scandina Countries, W76-12473

Mill Effluent Treatment and Fiber Recove W76-12474

Phenolic and Chlorophenolic Oligomer Chlorinated Pine Kraft Pulp and in B Plant Effluents, W76-12475

On the Pollution of Water of Some Riv the Kasumigaura Lake Basin, (In Japanese W76-12568

Second Attempt to Treat Anglia's Wastes, W76-12632

INDUSTRIAL WATER
Elaboration and Use of a Mathematical to Forecast in Quantity and Quality, The Demands of Various Sectors of Industry, W76-12562

INFECTION WELLS
Recent Advances in Artificial Recharge, W76-12295

INFRARED RADIATION
Remote Sensing of Mississippi River C teristics, W76-12442

INLETS (WATERWAYS)
Increasing the Mean Current in Coastal nels, W76-12201

INORGANIC CARBON
Carbon Contents of Surface and Under Waters in South-Central Minnesota, W76-12202

INORGANIC COMPOUNDS
Analysis of High-Purity Water and A Spark Source Mass Spectrometry, W76-12483

INSECT CONTROL
The Effect of Methods of Operation tion Basins on the Development and Po Density of Culex Pipiens L. in the Sou Russian SFSR, (In Russian), W76-12419

UNIVERSITY OF ILLINOIS URBANA-CHAMPAIGN

NSECTICIDES
Effect of Lindane on Trout Fry (Salmo Irideus Gibb.) Changes in Glycolytic Enzymes, (In French),
W76-12253 5C

STITUTIONS
Reform of Illinois Water Resource Laws with Particular Reference to the Drainage Code and Closely Related Laws,
W76-12217 6E

STRUMENTATION
Development of a Radioactive Isotope Profiling Snow Gage,
W76-12159 2C

Ocean 72, IEEE International Conference on Engineering in the Ocean.
W76-12224 5G

Basic Remote Sensing Investigations for Beach Reconnaissance: An Interim Report,
W76-12375 2L

Fast Current Oil Response Systems, Tests on Phase I Concepts,
W76-12385 5G

Capacitance Sensor for Soil Moisture Measurement,
W76-12457 2G

Nuclear Magnetic Resonance Sensors for Moisture Measurement in Roadways,
W76-12458 2G

Water-Pollution Instrumentation,
W76-12653 5A

EGRATED CONTROL MEASURES
Design of Integrated Approach to Nutrient Removal,
W76-12635 5D

ERBLOCK TRANSMISSIVITIES
Note on Computing Finite Difference Interblock Transmissivities,
W76-12292 2F

ERDISCIPLINARY MODEL
An Interdisciplinary Mathematical Model Applied to the Southern Bight of the North Sea,
W76-12518 5B

ERDISCIPLINARY MODELS
Interdisciplinary Models of Water Systems,
W76-12516 6A

ERLAKE AREA (MANITOBA)
A Dynamic Regional Model for Evaluating Source Development Programs,
W76-12520 4A

ERTIDAL AREAS
Basic Remote Sensing Investigations for Beach Reconnaissance: An Interim Report,
W76-12375 2L

ERTEBRATE DRIFT
A Study of the Effects of Stream Channelization and Bank Stabilization on Warmwater Sport Fish in Iowa: Subproject 4: The Effects of Longreach Channelization on Habitat and Invertebrate in Some Iowa Streams,
W76-12231 4C

ESTMENT
Use of Investment Models for the Long-Term Planning of a Water Resource System for England and Wales,
W76-12557 6A

ION EXCHANGE
Utilization of Clear Water Sewage Effluent in Mineral Processing,
W76-12464 5D

Removal and Recovery of Phenols from Industrial Waste Effluents with Amberlite XAD Polymeric Adsorbents,
W76-12487 5D

Ammonia Removal from Wastewater by Ligand Exchange,
W76-12611 5D

Ion Exchange Removal of Inorganic and Organic Wastewater Constituents,
W76-12624 5D

Wastewater Treatment - Physical and Chemical Methods, (Literature Review),
W76-12629 5D

IONS
Several Water Chemistry Data on the Knowledge of the Section of the Danube Between Budapest and Turnu Severin (1645-930 km) (Danubialia Hungarica LXVII), (In German),
W76-12574 5A

IOWA
A Study of the Effects of Stream Channelization and Bank Stabilization on Warmwater Sport Fish in Iowa: Subproject 5: Effects of Long-Reach Stream Channelization on Distribution and Abundance of Fishes,
W76-12230 4C

A Study of the Effects of Stream Channelization and Bank Stabilization on Warmwater Sport Fish in Iowa: Subproject 4: The Effects of Longreach Channelization on Habitat and Invertebrate in Some Iowa Streams,
W76-12231 4C

A Study of the Effects of Stream Channelization and Bank Stabilization on Warmwater Sport Fish in Iowa: Subproject No. 3 Some Effects of Short-Reach Channelization on Fish and Fish Food Organisms, in Central Iowa Warm Water Stream,
W76-12232 4C

A Study of the Effects of Stream Channelization and Bank Stabilization on Warmwater Sport Fish in Iowa: Subproject 2. A Study of the Impact of Selected Bank Stabilization Structures on Game Fish and Associated Organisms,
W76-12233 4C

A Study of the Effects of Stream Channelization and Bank Stabilization on Warm Water Sport Fish in Iowa: Subproject I Inventory of Major Stream Alterations in Iowa,
W76-12234 4C

Warm Water Stream Alteration in Iowa: Extent, Effects on Habitat, Fish, and Fish Food, and Evaluation of Stream Improvement Structures (Summary Report),
W76-12235 4C

Sampling and Calculation Methods for Determining Quantities of Nitrogen and Phosphorus in Watershed Runoff,
W76-12372 5A

IRON
Degradation of DDT in an Everglades Muck as Affected by Lime, Ferrous Iron and Anaerobiosis,
W76-12254 5B

IRRADIATION
On the Mechanism of Gamma-Radiolysis of Effluents (K mekhanizmu gamma-radioliza stochnykh vod),
W76-12508 5D

IRRIGATION
Sanitary Evaluation of the Conditions of Soil Decontamination of Wastewaters of Hydrolysis Plants of the Uzbek SSR, (In Russian),
W76-12257 5D

Ground-Water Resources of Lane and Scott Counties, Western Kansas,
W76-12298 4B

Management of Runoff Water in Relation to Feedlot Operations,
W76-12365 5D

Optimization of Design Capacity of an Aqueduct,
W76-12526 4A

Living Filter Perks up Regional System,
W76-12607 5D

Removal of Phosphorus and Nitrogen from Wastewater by Spray Irrigation of Land,
W76-12619 5D

Effluent Irrigation of Rye and Ryegrass,
W76-12644 5D

IRRIGATION DESIGN
Sprinkler Irrigation Design Criteria for Sugar Beets,
W76-12374 3F

IRRIGATION EFFECTS
Persistence of Virus on Sewage-Irrigated Vegetables,
W76-12634 5B

IRRIGATION EFFICIENCY
Water Production Functions and Predicted Irrigation Programs for Principal Crops as Required for Water Resources Planning and Increased Water Use Efficiency,
W76-12236 3F

Every-Other Furrow Irrigation of Corn,
W76-12371 3F

Filter Especially Intended for Filtering Natural Water for the Irrigation of Cultivated Fields,
W76-12400 3F

IRRIGATION PRACTICES
Every-Other Furrow Irrigation of Corn,
W76-12371 3F

Filter Especially Intended for Filtering Natural Water for the Irrigation of Cultivated Fields,
W76-12400 3F

IRRIGATION SCHEDULING
Fundamentals of Programmed Soil Moisture Depletion,
W76-12373 3F

IRRIGATION WELLS
Water-Level Changes in Southwestern Kansas, 1940-75,
W76-12297 4B

ISLANDS
Thermal Analysis of Frozen Embankment Islands,
W76-12200 2L

ISOLATION
Environmental Factors Influencing Isolation of Enteroviruses from Polluted Surface Waters,
W76-12171 5A

Isolation of Parasitic and Saprophytic Strains of Bdellovibrio Bacteriovorus from Natural Waters, (In Russian),
W76-12262 5A

ISOPHTHALONITRILE
The Extent of Hazard and the Hygienic Standardization of Isophthalonitrile in Bodies of Water, (In Russian),
W76-12286 5C

ISOPODS
Effects of Copper on Survival and Osmoregulation in Marine and Brackish Water Isopods (Crustacea),
W76-12333 5C

ISOTOPE FRACTIONATION
Oxygen Isotope Studies on Sea Ice in the Gulf of St. Lawrence,
W76-12448 2C

ISOTOPE STUDIES
Oxygen Isotope Studies on Sea Ice in the Gulf of St. Lawrence,
W76-12448 2C

ISOTOPIC ENRICHMENT
Oxygen Isotope Studies on Sea Ice in the Gulf of St. Lawrence,
W76-12448 2C

ISOTROPIC MEDIA
On the General Equations for Flow in Porous Media and Their Reduction to Darcy's Law,
W76-12199 2F

IVORY COAST WATERS
Hydrocarbon Residues in Ivory Coast Waters,
W76-12579 5C

JELLY FISH
An Alternate Grazing Hypothesis for the Patuxent Estuary,
W76-12396 2L

JETTIES
A Study of the Effects of Stream Channelization and Bank Stabilization on Warmwater Sport Fish in Iowa: Subproject 2. A Study of the Impact of Selected Bank Stabilization Structures on Game Fish and Associated Organisms,
W76-12233 4C

JUNCTIONS
Supercritical Flow at Open-Channel Junctions; Hydraulic Model Investigation,
W76-12187 8B

JURISDICTION
Reform of Illinois Water Resource Laws with Particular Reference to the Drainage Code and Closely Related Laws,
W76-12217 6E

JUVENILE GROWTH STAGE
Toxicity of Ammonia, Nitrite Ion, Nitrate Ion, and Orthophosphate to Mercenaria Mercenaria and Crassostrea Virginica,
W76-12237 5C

KANSAS
A Study of the Utilization of ERTS-1 Data from the Wabash River Basin,
W76-12183 7B

Water-Level Changes in Southwestern Kansas, 1940-75,
W76-12297 4B

Ground-Water Resources of Lane and Scott Counties, Western Kansas,
W76-12298 4B

KAPCHAGAI RESERVOIR (USSR)
Destruction of Organic Matter in Grounds of Kapchagai Reservoir, (In Russian),
W76-12320 5C

KASUMIGAURA LAKE BASIN (JAPAN)
On the Pollution of Water of Some Rivers in the Kasumigaura Lake Basin, (In Japanese),
W76-12568 5B

KATTEGAT
Sea Level Computations of the Baltic with a 20-Canal Model,
W76-12205 2L

KEWAUNEE RIVER
Sediment Yields from Roadsides: An Application of the Universal Soil Loss Equation,
W76-12206 4C

KIEV WATER STORAGE RESERVOIR (USSR)
Seston of the Kiev Water Reservoir and Quantitative Ratios of Its Components, (In Russian),
W76-12302 5C

KINEMATIC WAVE EQUATION
Derivation of Time of Concentration,
W76-12196 2E

KINETICS
Kinetics and Process Control of Nitrification in Completely Mixed Biological Wastewater Treatment,
W76-12620 5D

KNOB LAKE (ONTARIO)
Field Determination of the Densities of Lake Ice Sheets,
W76-12429 2C

KRAFT MILL
Effects of a Waste of 'Paper Kraft' on the Benthic Algal Populations in N.W. Spain. 'Stress' on the Fucaceae Standing Crop, (In Spanish),
W76-12327 5C

KRAFT MILLS
First Closed-Cycle Kraft Mill,
W76-12488 5D

KREMENCHUG RESERVOIR (USSR)
Distribution of Heterotrophic Bacteria in Water and Bottom Deposits of the Kremenchug Reservoir in Relation to the Intensity of Development of Blue-Green Algae, (In Russian),
W76-12306 5C

LABORATORY EQUIPMENT
Laboratory Comparisons of Four Surface Microlayer Samplers,
W76-12397 2K

LABORATORY TESTS
DDT Causes Changes in Activity and Schooling Behavior in Goldfish,
W76-12330 5C

Wave Forces on Vertical Circular Cylinder,
W76-12443 8B

LAGOON OF L'OLIVIER (FRANCE)
First Data on the Experimental Study of the Zinc Cycle in the Lagoon of L'Olivier, (In French),
W76-12310 5A

LAGOONS
Lagoons and Oxidation Ponds, (Literature Review),
W76-12671 5D

LAKE BASINS
Sediment Discharge from Highway Cut-Slopes in the Lake Tahoe Basin, California, 1972-74,
W76-12279 4C

LAKE ERIE
Mineralogy and Related Parameters of Fluvia Suspended Sediments in Northwestern Ohio,
W76-12203 2

LAKE FLUSHING RATES
Ground-Water and Surface-Water Relation ships in the Glacial Province of Norther Wisconsin - Snake Lake,
W76-12444 5C

LAKE FREEMAN (IND)
A Study of the Utilization of ERTS-1 Da from the Wabash River Basin,
W76-12183 7

LAKE GEORGE (NY)
Documentation of Selected Constructs a Parameter Values in the Aquatic Mod Cleaner,
W76-12519 5

LAKE ICE
Field Determination of the Densities of La Ice Sheets,
W76-12429 2

LAKE IZABEL CATCHMENT BASIN
Organic Matter Losses from Four Watershe in the Humid Tropics,
W76-12428

LAKE LINDU (INDONESIA)
Schistosomiasis and Other Human Parasito of Lake Lindu in Central Sulawesi (Celebe Indonesia,
W76-12573

LAKE MANYCH-GUDILO (USSR)
Contribution to Epizootology of Schistocep lus Pungitii (Ligulidae) in the Manych-Gu Lake, (In Russian),
W76-12273

LAKE ONTARIO
Lake Ontario Circulation in November,
W76-12430

LAKE REJUVENATION
Ground-Water and Surface-Water Relat ships in the Glacial Province of Nort Wisconsin - Snake Lake,
W76-12444

LAKE SEDIMENTS
An Historical Perspective of Nutrient In and Trophic States as Deduced from Ca Lake Sediments,
W76-12463

Microbiological Characterization of the Lu trine Deposit Laid Open by Drying up o Greaca Lake, (In Romanian),
W76-12571

UNIVERSITY OF ILLINOIS AT URBANA-CHAMPAIGN

LAKE SHAFER (IND)
A Study of the Utilization of ERTS-1 Data from the Wabash River Basin,
W76-12183 7B

LAKE SHORES
The Recreational Use of Water as Part of the Integrated Planning of Large Water Systems,
W76-12567 6B

LAKE TAHOE BASIN (CALIF)
Sediment Discharge from Highway Cut-Slopes in the Lake Tahoe Basin, California, 1972-74,
W76-12279 4C

LAKE TRAKOSCAN (YUGOSLAVIA)
The Influence of Grass-Carp Population (Ctenopharyngodon Idella Val.) on the Vegetation and Ecosystem of Lake Trakoscan, (In Serbo-Croatian),
W76-12272 5C

LAKES
The Trophic State of North Carolina Lakes,
W76-12210 5C

Field Determination of the Densities of Lake Ice Sheets,
W76-12429 2C

Lake Ontario Circulation in November,
W76-12430 2H

Ground-Water and Surface-Water Relationships in the Glacial Province of Northern Wisconsin - Snake Lake,
W76-12444 5G

Phosphate Release and Sorption by Lake Mohegan Sediments,
W76-12512 5C

A Eutrophication Model for a Lake,
W76-12515 5C

Documentation of Selected Constructs and Parameter Values in the Aquatic Model Cleaner,
W76-12519 5C

LAMPRICIDES
Gas-Liquid Chromatographic Determination of 3-Trifluoromethyl-4-Nitrophenol in Natural Waters,
W76-12486 5A

LAND APPLICATION
Disposal Alternatives for Intermittent Sand Filter Scrapings Utilization and Sand Recovery,
W76-12219 5D

LAND DISPOSAL
Relating Agricultural Instruction to Environment Improvement: The Role of Land and Soil,
W76-12354 5G

Animal Waste and Nitrate Movement Through Soil,
W76-12362 5B

LAND MANAGEMENT
Water Yield Improvement Research of the Pacific Southwest Forest and Range Experiment Station and its Usefulness to Wildland Resource Management,
W76-12170 4C

LAND RECLAMATION
Bayesian Approach to Tile Drain Design,
W76-12527 8B

LAND SPREADING
Maine Guidelines for Manure and Manure Sludge Disposal on Land.
W76-12353 5G

LAND USE
Major Floods, Poor Land Use Delay Return of Sedimentation to Normal Rates,
W76-12157 4D

Impact of Hurricane Tidal Surges on Subsequent Land Use Changes and Water Resources Reallocation,
W76-12461 4A

Report of the Qu'Appelle Basin Study Board.
W76-12587 5G

Sod Production: An Experiment in Sludge Disposal,
W76-12633 5E

LANDFILLS
Evaluation of Solid Waste Baling and Balefills. Volume I,
W76-12381 5A

LANDSLIDES
Map of Overdip Slopes that Can Affect Landsliding in Armstrong County, Pennsylvania,
W76-12300 7C

LAPLACE TRANSFORMATIONS
Unsteady Flow to a Nonpenetrating Artesian Well,
W76-12445 2F

LARVAL GROWTH STAGES
Survival of White Amur Larvae Under the Effect of Zinc Sulfate, (In Russian),
W76-12312 2I

LASER RADIATION
Response of Water-Hyacinth to Laser Radiation,
W76-12406 4A

LATITUDINAL STUDIES
Shadow Length Tables for Latitude 50 Degrees North,
W76-12243 4A

Shadow Length Tables for Latitude 44 Degrees North,
W76-12244 4A

Shadow Length Tables for Latitude 46 Degrees North,
W76-12245 4A

Shadow Length Tables for Latitude 48 Degrees North,
W76-12246 4A

Shadow Length Tables for Latitude 38 Degrees North,
W76-12247 4A

Shadow Length Tables for Latitude 40 Degrees North,
W76-12248 4A

LEACHATE
Analytical Solution of the Equation for Transport of Reactive Solutes Through Soils,
W76-12450 2G

LEACHING
Animal Waste and Nitrate Movement Through Soil,
W76-12362 5B

Utilization of Clear Water Sewage Effluent in Mineral Processing,
W76-12464 5D

LEAD
Lead Nitrate Poisoning in the Carp (Cyprinus Carpio L.):Localization of the Pollutant in the Body, (In French),
W76-12251 5A

LEAKY ARTESIAN CONDITIONS
Unsteady Flow to a Nonpenetrating Artesian Well,
W76-12445 2F

LEASES
Identification and Mapping of Fishing Banks on the Outer Continental Shelf of the Gulf of Mexico,
W76-12228 6G

LEGAL ASPECTS
Cost of Water Pollution Control in the Carpet Industry,
W76-12422 5G

Tannery Waste Management, (Literature Reviews),
W76-12423 5D

LEGISLATION
Water Quality Law in Federal Republic of Germany,
W76-12531 5G

LENINGRAD (USSR)
Experience in Decontamination of Industrial Wastes and Treatment Plant Sediments in Leningrad, (In Russian),
W76-12291 5D

LERMICHTHYS-MULTIRADIATUS
Discovery of Ligula Intestinalis (Goeze 1782) Gmelin, 1790 in Lermichthys Mutiradiatus (Meek) (Pisces: Goodeidae), (In Spanish),
W76-12274 5C

LETHAL LIMIT
Toxicity of Ammonia, Nitrite Ion, Nitrate Ion, and Orthophosphate to Mercenaria Mercenaria and Crassostrea Virginica,
W76-12237 5C

Principle of a Technical Device for the Study of Toxic Effluents in Water Pollution, (In French),
W76-12255 5A

Hygienic Substantiation of the Maximum Permissible Concentration of Hydrogen Peroxide in Surface Waters, (In Russian),
W76-12315 5A

Effects of Copper on Survival and Osmoregulation in Marine and Brackish Water Isopods (Crustacea),
W76-12333 5C

LIGAND EXCHANGE
Ammonia Removal from Wastewater by Ligand Exchange,
W76-12611 5D

LIGHT INTENSITY
Controlling Solar Light and Heat in a Forest by Managing Shadow Sources,
W76-12241 4A

LIGNINS
Effects of a Waste of 'Paper Kraft' on the Benthic Algal Populations in N.W. Spain.

LIGNINS

'Stress' on the Fucaceae Standing Crop, (In Spanish),
W76-12327 5C

LIGULA-INTESTINALIS
Discovery of Ligula Intestinalis (Goeze 1782) Gmelin, 1790 in Lermichthys Mutiradiatus (Meek) (Pisces: Goodeidae), (In Spanish),
W76-12274 5C

LIME
Degradation of DDT in an Everglades Muck as Affected by Lime, Ferrous Iron and Anaerobiosis,
W76-12254 5B

Recovery of P205 from Waste-Waters by Adding Lime (Sekkai Shori Ni Yoru Haisuichu No P2O5 No Kaishu),
W76-12660 5D

LIMNOBIOLOGY
On Hydrobiology: Critical Misapprehensions Concerning the Discipline, (In Hungarian),
W76-12269 2A

LINDANE
Effect of Lindane on Trout Fry (Salmo Irideus Gibb.) Changes in Glycolytic Enzymes, (In French),
W76-12253 5C

LINEAR BINARY OPTIMIZATION
The Solution of the Regionalization Problem by Certain Branch-and-Bound Methods,
W76-12552 5D

LINEAR PROGRAMMING
Optimization of Real Time Daily Operation of a Multiple Reservoir System,
W76-12155 4A

A Quantitative Model for the Planning of Surface Water Resources: Use of Mixed Variable Linear Programming,
W76-12546 4A

Simplified Decision Model for National Water Supply Development,
W76-12564 6A

LIPOPHILIC SUBSTANCES
Decontamination of Water Containing Lipophilic Substances.

Snow Wetness Measurements for Melt Forecasting,
W76-12165 2C

Frost, Moisture, and Erosion.
W76-12451 2G

Case Studies of Variations in Subgrade Moisture and Temperature Under Road Pavements in Virginia,
W76-12454 2C

MOLLUSKS
Release of the Carcinogen Benzo(a) Pyrene from Environmentally Contaminated Mussels,
W76-12328 5B

MONITORING
Self-Monitoring Procedures: Basic Laboratory Skills (164.6) Student Reference Manual,
W76-12377 5A

Evaluation of Solid Waste Baling and Balefills. Volume I,
W76-12381 5A

Dissolved Oxygen Probe,
W76-12391 5D

Technique for Continulusly Analyzing the Concentration of Ozone Dissolved in Water,
W76-12405 5F

Water-Pollution Instrumentation,
W76-12653 5A

MONTANA
Groundwater Property Rights and Controversies in Montana,
W76-12154 6E

Chemical Characteristics of the Major Thermal Springs of Montana,
W76-12293 2K

Water Quality and Waste Disposal in Montana,
W76-12359 5C

MONTANA WATER LAW
Groundwater Property Rights and Controversies in Montana,
W76-12154 6E

MONTEREY BAY (CA)
Mesoscale Spatial and Temporal Variations of Water Mass Characteristics in the California Current Region off Monterey Bay in 1973-1974,
W76-12386 2L

Mesoscale Component of the Geostrophic Flow and its Temporal and Spatial Variability in the California Current off Monterey Bay in 1973-4,
W76-12387 2L

MOORING SYSTEMS
High Seas Oil Containment Barrier Mooring System,
W76-12384 5G

MORTALITY
Effects of Copper on Survival and Osmoregulation in Marine and Brackish Water Isopods (Crustacea),
W76-12333 5C

MOSQUITOES
The Effect of Methods of Operation of Aeration Basins on the Development and Population Density of Culex Pipiens L. in the South of the Russian SFSR, (In Russian),
W76-12419 5G

MOUNTAINS
A High Sierra Precipitation Measurement Program, Final Report on the 1975 Season,
W76-12446 2B

MUD
The Influence of Grass-Carp Population (Ctenopharyngodon Idella Val.) on the Vegetation and Ecosystem of Lake Trakoscan, (In Serbo-Croatian),
W76-12272 5C

An Inexpensive Sampler for Studying the Microbiology of River Mud,
W76-12599 5A

MULTIPLE OBJECTIVES
Evaluating Tisza River Basin Development Plans Using Multiattribute Utility Theory,
W76-12534 4A

MULTIPLE-PURPOSE PROJECTS
Application of Dynamic Programming in Framing Operating Rules for a Multi-Purpose Dam,
W76-12541 4A

MULTIPLE-PURPOSE RESERVOIRS
Optimization of Real Time Daily Operation of a Multiple Reservoir System,
W76-12155 4A

MULTIVARIATE ANALYSIS
Multivariate Analysis of Georgia Coastal Plain Groundwaters,
W76-12466 2F

MUNICIPAL WASTE WATER
Utilization of Clear Water Sewage Effluent in Mineral Processing,
W76-12464 5D

MUNICIPAL WASTES
Studies on the Algal Colonization of the Saale River Near Jena: Part I. The Test Area and its Non-Biological Properties, (In German),
W76-12166 5A

Water Pollution Control in the Scandinavian Countries,
W76-12473 5D

On the Pollution of Water of Some Rivers in the Kasumigaura Lake Basin, (In Japanese),
W76-12568 5B

Ammonia Removal from Wastewater by Ligand Exchange,
W76-12611 5D

Submersible Pumps Upgrade Sewage Handling.
W76-12614 5D

Ion Exchange Removal of Inorganic and Organic Wastewater Constituents,
W76-12624 5D

Wastewater Resources in North Central Texas,
W76-12652 5G

MUNICIPAL WATER
Sanitary and Hygienic Evaluation of the Water of the Uzhgorod Water Supply System, (In Russian),
W76-12313 5A

Hygienic Substantiation of the Maximum Permissible Concentration of Hydrogen Peroxide in Surface Waters, (In Russian),
W76-12315 5A

MUSKEGON COUNTY (MICH)
Living Filter Perks up Regional System,
W76-12607 5D

MUSKINGUM FLOOD ROUTING PROCEDURE
Planning the Location and Capacity of Flood Control Structures,
W76-12156 4A

MUSSELS
Effects of a Waste of 'Paper Kraft' on the Benthic Algal Populations in N.W. Spain. 'Stress' on the Fucaceae Standing Crop, (In Spanish),
W76-12327 5C

Release of the Carcinogen Benzo(a) Pyrene from Environmentally Contaminated Mussels,
W76-12328 5B

NARRAGANSETT BAY (RI)
An In-Situ Investigation of Oil Barrier Shape and Drag Coefficients,
W76-12378 5G

NATIONAL RECREATION AREAS
Outdoor Recreation Planning and Research in the U.S.A.,
W76-12585 6B

NAVIGATION
A Legal-Historical Analysis of Navigation User Charges,
W76-12532 6E

NAVIGATION USER CHARGES
A Legal-Historical Analysis of Navigation User Charges,
W76-12532 6E

NAYLOR'S RUN CREEK (PENN)
Some Observations Regarding Pentachlorophenol Levels in Haverford Township, Pennsylvania,
W76-12591 5B

NEBRASKA
Little Pollution from This Feedlot.
W76-12350 5G

Sprinkler Irrigation Design Criteria for Sugar Beets,
W76-12374 3F

NEPHELOMETRIC METHOD
Automatic Determination of Sulfates by an Improved Nephelometric Method: Application to the Determination of SO2 in Atmospheric Air and of Sulfates in Rain Water, (In French),
W76-12259 5A

NETWORK ANALYSIS
Multipurpose Computer for the Honolulu Board of Water Supply,
W76-12589 4B

NEW HAMPSHIRE
Role of Agriculture in the Quality of the New Hampshire Environment,
W76-12337 5G

LIBRARY U. OF I. URBANA-CHAMPAIGN

NEW HAMPSHIRE

Monadnock Cleans Up: Specialty Paper Mill Installs $1eMillion Waste Treatment System.
W76-12490 5D

NEW JERSEY

Predicted Oil Slick Movement from Various Locations Off the New Jersey-Delaware Coastline,
W76-12376 5B

NEW MEXICO

Revegetating Devastated Sites in New Mexico with Western Wheatgrass Transplants,
W76-12161 4C

Flood Discharge of Streams in New Mexico as Related to Channel Geometry,
W76-12294 2E

NEW YORK

Phosphorus Loss by Stream Transport from a Rural Watershed: Quantities, Processes, and Sources,
W76-12435 5B

An Historical Perspective of Nutrient Inputs and Trophic States as Deduced from Cayuga Lake Sediments,
W76-12463 5C

Documentation of Selected Constructs and Parameter Values in the Aquatic Model Cleaner,
W76-12519 5C

Northeastern United States Water Supply Study, Interim Report, Critical Choices for Critical Years.
W76-12584 6D

NEW YORK BIGHT

Contaminant Effects on Biota of the New York Bight,
W76-12229 5C

Predicted Oil Slick Movement from Various Locations Off the New Jersey-Delaware Coastline,
W76-12376 5B

Evaluation of Proposed Sewage Sludge Dumpsite Areas in the New York Bight.
W76-12469 5E

NEW YORK METROPOLITAN AREA

Northeastern United States Water Supply Study, Interim Report, Critical Choices for Critical Years.
W76-12584 6D

NEWTONIAN FLUID

On the General Equations for Flow in Porous Media and Their Reduction to Darcy's Law,
W76-12199 2F

NIMBUS-4

Study of the Lower Stratospheric Thermal Structure and Total Ozone from Nimbus-4 IRIS,
W76-12184 2B

NITRATES

Toxicity of Ammonia, Nitrite Ion, Nitrate Ion, and Orthophosphate to Mercenaria Mercenaria and Crassostrea Virginica,
W76-12237 5C

Lead Nitrate Poisoning in the Carp (Cyprinus Carpio L.):Localization of the Pollutant in the Body, (In French),
W76-12251 5A

Water Quality and Waste Disposal in Montana,
W76-12359 5C

Animal Waste and Nitrate Movement Through Soil,
W76-12362 5B

The Eutrophication of Titi Lake and its Consequences for the Population of Dynamics of Zooplankton: 2, (In German),
W76-12594 5C

Nitrate Reduction in Peat,
W76-12625 5D

NITRIFICATION

Types of Micro-Organisms in Activated Sludge in Dependence of Temperature and Nitrification (Die Besiedlung Des Belebten Schlammes in Abhaengigkeit Von Temperatur und Nitrifikation),
W76-12615 5A

Nitrifying Organism Concentration and Activity,
W76-12647 5D

NITRIFYING BACTERIA

Concentrations of Nitrifying Bacteria in Sewages, Effluents, and a Receiving Stream and Resistance of These Organisms to Chlorination,
W76-12654 5D

NITRITES

Toxicity of Ammonia, Nitrite Ion, Nitrate Ion, and Orthophosphate to Mercenaria Mercenaria and Crassostrea Virginica,
W76-12237 5C

NITROGEN

Dissolved Nutrient Losses in Storm Runoff from Five Southern Pine Watersheds,
W76-12172 5B

A Limnological Study of Spiritwood Lake, N. D., With Special Emphasis on Its Water Quality, Seasonal Cycles of Chemical Nutrients Phytoplankton, Zooplankton and Primary Production, Part II: Causes and Control of Algal Blooms in Spiritwood Lake, North Dakota,
W76-12214 5C

Sampling and Calculation Methods for Determining Quantities of Nitrogen and Phosphorus in Watershed Runoff,
W76-12372 5A

Microbiological Transformation of Carbon Nitrogen, Sulfur, Iron, Phosphorus and Calcium Compounds in Lake Reservoirs, (In Polish),
W76-12494 5C

Nitrogen Availability in Urban Runoff,
W76-12596 5B

Improvements in and Relating to Waste Water Treatment,
W76-12603 5D

Removal of Phosphorus and Nitrogen from Wastewater by Spray Irrigation of Land,
W76-12619 5D

NITROGEN COMPOUNDS

On Environmental Factors of Eel Pools: I. Chemistry of the Water and Soil and Plankton in October 1965 and July 1966, (In Japanese),
W76-12275 5C

The Extent of Hazard and the Hygienic Standardization of Isophthalonitrile in Bodies of Water, (In Russian),
W76-12286 5C

NITROGEN FIXING BACTERIA

Concentrations of Nitrifying Bacteria in Sewages, Effluents, and a Receiving Stream and Resistance of These Organisms to Chlorination,
W76-12654 5D

NON-STRUCTURAL ALTERNATIVES

Development of Residuals Management Strategies,
W76-12581 5G

Flood Plain Information: Freshwater Creek, Humboldt County, California.
W76-12593 4A

NONPENETRATING ARTESIAN WELLS

Unsteady Flow to a Nonpenetrating Artesian Well,
W76-12445 2F

NONWOVEN FABRIC FILTERS

Investigation of Filtration Characteristics of a Nonwoven Fabric Filter,

A Quantitative Model for the Planning of Surface Water Resources: Use of Mixed Variable Linear Programming,
W76-12546 4A

Simulation Model of the Quantitative and Qualitative Evolution of Water Resources at Different Points of a River-Basin (Orne),
W76-12555 4A

The 'Polpole' Model: An Attempt to Analyse the Water System in the Financial Agency of a French River Basin,
W76-12556 4A

Construction and Utilization of Complex Mathematical Models in the Planning of the Optimal Development of Large Hydrographic Systems and River Basins,
W76-12566 4A

RIVER FORECAST SERVICES

Flood Damage Reduction Potential of Riv Forecast Services in the Connecticut Riv Basin,
W76-12186 4

RIVER FORECASTING

Flood Damage Reduction Potential of Riv Forecast Services in the Connecticut Riv Basin,
W76-12186 4

RIVER MUD

An Inexpensive Sampler for Studying t Microbiology of River Mud,
W76-12599

RIVER SYSTEMS

River System Modelling for Operatio Forecasting,
W76-12550

RIVERS

Applicability of Unit Stream Power Equation
W76-12193

Remote Sensing of Mississippi River Char teristics,
W76-12442

On the Pollution of Water of Some Rivers the Kasumigaura Lake Basin, (In Japanese),
W76-12568

ROAD CONSTRUCTION

Sediment Discharge from Highway Cut-Slo in the Lake Tahoe Basin, California, 1972-74
W76-12279

Frost, Moisture, and Erosion.
W76-12451

Evaluation of Pavement Drainage Syste Made of Layers of Open-Graded Bitumin Aggregate Mixtures,
W76-12456

ROADBANKS

Sediment Yields from Roadsides: An Appl tion of the Universal Soil Loss Equation,
W76-12206

ROADS

Case Studies of Variations in Subgr Moisture and Temperature Under Road Pa ments in Virginia,
W76-12454

RUNHYDROGRAPHS

A Method of Finding the Family of Runhyd graphs for Given Return Periods,
W76-12195

RUNOFF

Derivation of Time of Concentration,
W76-12196

Organic Matter Losses from Four Watersh in the Humid Tropics,
W76-12428

Plot-Derived Parameters for Basin Comp tions,
W76-12438

A Snowmelt Runoff Model and its Applica to Short-Range Forecasting of Fl Discharges,
W76-12440

Water Yield Model Using SCS Curve N bers,
W76-12522

LIBRARY U. OF I. URBANA-CHAMPAIGN

RUNOFF FORECASTING
Snow Wetness Measurements for Melt Forecasting,
W76-12165 2C

RURAL WATERSHEDS
Phosphorus Loss by Stream Transport from a Rural Watershed: Quantities, Processes, and Sources,
W76-12435 5B

RYE
Effluent Irrigation of Rye and Ryegrass,
W76-12644 5D

RYEGRASS
Effluent Irrigation of Rye and Ryegrass,
W76-12644 5D

SAALE RIVER (E GERMANY)
Studies on the Algal Colonization of the Saale River Near Jena: Part I. The Test Area and its Non-Biological Properties, (In German),
W76-12166 5A

SALINE WATER
1973-1974 Saline Water Conversion Summary Report.
W76-12343 3A

SALINITY
Hydrography and Phytoplankton of the Coast of Castellon, from September 1969 to January 1971, (In Spanish),
W76-12164 5A

Effects of Temperature and Salinity on Growth and Uptake of 65ZN and 137CS for Six Marine Algae,
W76-12238 5C

Effects of Copper on Survival and Osmoregulation in Marine and Brackish Water Isopods (Crustacea),
W76-12333 5C

Mesoscale Spatial and Temporal Variations of Water Mass Characteristics in the California Current Region off Monterey Bay in 1973-1974,
W76-12386 2L

Chemical and Microbiological Degradation of Malathion and Parathion in an Estuarine Environment,
W76-12437 5B

Systems Simulation as a Tool for Water Resource Planning, Including Qualitative Aspects,
W76-12551 4A

SAMPLING
Sampling and Calculation Methods for Determining Quantities of Nitrogen and Phosphorus in Watershed Runoff,
W76-12372 5A

Laboratory Comparisons of Four Surface Microlayer Samplers,
W76-12397 2K

Some Observations Regarding Pentachlorophenol Levels in Haverford Township, Pennsylvania,
W76-12591 5B

An Inexpensive Sampler for Studying the Microbiology of River Mud,
W76-12599 5A

A Counterstaining Technique for Use in Sorting Benthic Samples,
W76-12606 2I

SAND FILTERS
Disposal Alternatives for Intermittent Sand Filter Scrapings Utilization and Sand Recovery,
W76-12219 5D

Elimination of Trace-Elements by Slow-Sand-Filtration (Eliminierung Von Spurenmetallen Durch Langsamsandfilter),
W76-12616 5D

SANITARY ENGINEERING
Wastewater Reclamation and Re-Use: The Responsibilities of the Consulting Engineer,
W76-12622 5D

SARDINELLA
Hydrocarbon Residues in Ivory Coast Waters,
W76-12579 5C

SASKATCHEWAN
Report of the Qu'Appelle Basin Study Board.
W76-12587 5G

Water Quality Objectives.
W76-12588 5G

SATELLITES (ARTIFICIAL)
A Study of the Utilization of ERTS-1 Data from the Wabash River Basin,
W76-12183 7B

Satellite Snow Observations and Seasonal Streamflow Forecasts,
W76-12468 2C

SATURATED SOILS
Engineering Properties of Compacted Clay Conditioned by Saturation and Freeze-Thaw Cycles,
W76-12453 2C

SCHEDULING
Fundamentals of Programmed Soil Moisture Depletion,
W76-12373 3F

SCHISTOCEPHALUS-PUNGITII
Contribution to Epizootology of Schistocephalus Pungitii (Ligulidae) in the Manych-Gudilo Lake, (In Russian),
W76-12273 5C

SCHISTOSOMIASIS
Schistosomiasis and Other Human Parasitoses of Lake Lindu in Central Sulawesi (Celebes), Indonesia.
W76-12573 5C

SCHOOL CREEK WATERSHED
Sediment Yields from Roadsides: An Application of the Universal Soil Loss Equation,
W76-12206 4C

SCREENING
The Renovation and Reuse of Water for Dilution and Hydraulic Transport of Dairy Cattle Manure,
W76-12345 5D

SEA BED
Evaluation of Proposed Sewage Sludge Dumpsite Areas in the New York Bight.
W76-12469 5E

SEA ICE
Oxygen Isotope Studies on Sea Ice in the Gulf of St. Lawrence,
W76-12448 2C

Some Remarks on the Unusual Beaufort Sea Ice Conditions in Summer 1975,
W76-12470 2C

SEA ICE MOVEMENT
Some Remarks on the Unusual Beaufort Sea Ice Conditions in Summer 1975,
W76-12470 2C

SEA LEVEL
Sea Level Computations of the Baltic with a 20-Canal Model,
W76-12205 2L

Sand Level Changes on Torrey Pines Beach, California,
W76-12383 2L

SEABIRDS
Studies on Oil Pollution and Seabirds in Denmark 1968-1971,
W76-12256 5C

SEASONAL
Seasonal Snow Surface Energy Balance in a Forest Opening,
W76-12160 2C

Sand Level Changes on Torrey Pines Beach, California,
W76-12383 2L

Seasonal Dynamics of the Periphytic Macrofauna in Carp Ponds in South-West Bohemia,
W76-12395 2H

SEDIMENT CONCENTRATION (RIVERS)
Applicability of Unit Stream Power Equation,
W76-12193 2J

SEDIMENT TRANSPORT
Mass Transport in Gravity Waves on a Sloping Bottom,
W76-12190 2L

Applicability of Unit Stream Power Equation,
W76-12193 2J

Sediment Discharge from Highway Cut-Slopes in the Lake Tahoe Basin, California, 1972-74,
W76-12279 4C

Quality of Surface Waters of the United States, 1970: Parts 12-16. North Pacific Slope Basins, Alaska, and Hawaii and Other Pacific Areas.
W76-12284 7C

Sand Level Changes on Torrey Pines Beach, California,
W76-12383 2L

Phosphorus Loss by Stream Transport from a Rural Watershed: Quantities, Processes, and Sources,
W76-12435 5B

SEDIMENT YIELD
Potential Effects of Forest Management Practices on Stormflow Sources and Water Quality,
W76-12173 5C

Sediment Yields from Roadsides: An Application of the Universal Soil Loss Equation,
W76-12206 4C

SEDIMENTATION
Major Floods, Poor Land Use Delay Return of Sedimentation to Normal Rates,
W76-12157 4D

Physicochemical Wastewater Treatment Methods, (In Greek),
W76-12555 5D

SEDIMENTS
A Uniform Measure of Subaerial Erosion,
W76-12191 2J

LIBRARY OF U. OF I. URBANA-CHAMPAIGN

SEDIMENTS

Mineralogy and Related Parameters of Fluvial Suspended Sediments in Northwestern Ohio,
W76-12203 2J
